Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html. Introduction

Tyre and road wear particles (TRWP) are formed from the friction between a tyre and roadway surface. The particles are subsequently released into nearby soil and sediment ecosystems. As such, there is interest in studying the composition and effects of TRWP on the environment (Kreider et al. 2010; Unice et al. 2015). This document provides guidelines for the generation of TRWP using a road simulator in a laboratory setting. The guidelines describe the method, apparatus and equipment, TRWP collection procedures, monitoring measures, and test report. An informative case study is also provided.

Generation of TRWP with a road simulator eliminates interferences from other roadway surface contaminants such as brake dust, oil and grease, soil, and vegetation (Kreider et al. 2010). This method allows for a more accurate characterization of the physical and chemical properties of TRWP than other generation methods including on-road collection and cryogenic breaking of rubber tread. In addition, a greater mass of TRWP can be collected using the road simulator laboratory method. Other laboratory generation methods (e.g., steel brush and grit paper) are not representative of actual driving conditions and may introduce additional interferences to the generated TRWP. Furthermore, previous analysis has shown that the particle morphology and size distribution of TRWP generated using on-road and road simulator methods are similar, with the on-road TRWP slightly smaller in size (Kreider et al. 2010).

Annex A gives information on a case study of TRWP generation.

Rubber — Generation and collection of tyre and road wear particles (TRWP) — Road simulator laboratory method

1 Scope

This document specifies a method for the generation of tyre and road wear particles (TRWP) in a road simulator laboratory that is representative of actual driving conditions. Guidance is provided for the road simulator system, test pavement and tyres, vacuum collection system, monitoring, and reporting.

This method is applicable for the collection of TRWP from a known pavement and tyre type under realistic driving conditions without the inference of road surface contaminants (i.e. brake dust, exhaust, grease, etc.).

There is a possibility that this method is not relevant for studded tyres.

2 Normative references

There are no normative references in this document.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <http://www.electropedia.org/>
- ISO Online browsing platform: available at <https://www.iso.org/obp>

3.1 monitoring

repeated measurement to follow changes over a period of time

3.2 particle

small discrete mass of solid or liquid matter

3.3 tyre and road wear particles TRWP

discrete mass of elongated particles generated at the frictional interface between the road and the pavement surface during the service life of a tyre

Note 1 to entry: The particles consist of tyre tread enriched with mineral encrustations from the roadway surface.

4 Apparatus and equipment

TRWP are generated from a tyre and pavement of known composition using a road simulator system used for TRWP generation, with an aspiration collection system. A precision balance is used to weigh collected TRWP, and collected TRWP shall be stored in amber glass jars.

4.1 Generation System

4.1.1 Characteristics, a testing facility consisting of a road simulation system fitted with road pavement cassettes is required for the TRWP generation. The system shall permit housing of at least one tyre in a manner such that the tyre interfaces the pavement cassettes similar to normal tyre operation. Systems such as the interior drum testing system (see [Figure 1](#)) or rotating tabletop systems can be considered for this application.

The generation system should be electronically programmable to mimic realistic driving parameters including speed, acceleration, loading, braking, and steering. The system shall be capable of a maximum test speed of at least 150 km/h. The drive capabilities should include adjustable camber angle between -2° and 8° , adjustable slip at the test wheel between 0 % and 100 %, and steering angle adjustable during operation of -15° to 15° . The radial force should be adjustable between -5 kN and 5 kN, and the normal force should be adjustable between 0 kN and 10 kN.

**Key**

- 1 drum drive engine, 200 kW, 200 rpm
 2 clutch
 3 brake (for casket mounting only)
 4 bearing
 5 surface of inner drum (filled caskets)
 6 bearing
 7 free-wheeling hub with disk brake
 8 tyre drive engine, 200 kW, 200 U/min
 9 wheel slide
 10 tyre load
 11 tyre wheel

Figure 1 — Conceptual schematic of interior drum testing facility

4.1.2 Monitoring, during operation, the system shall allow for monitoring of tyre speed, system temperature, and tyre forces and torques. Ventilation in the collection system (e.g. in ductwork of a drum rotator or within the enclosure for a tabletop generator) shall be measured and recorded.

4.2 Test pavement

The test pavement shall be contained in exchangeable cassettes. Test pavement shall be unweathered and mimic actual road pavement to generate representative TRWP. Pavement type may vary, but one suggestion is an asphalt-based pavement specified in ISO 10844. The surface area of the test pavement should be large enough to simulate actual rolling tyre movements.
