English version

Space product assurance - Worst case analysis

Assurance produit des projets spatiaux - Analyse pire cas

RaumfahrtProduktsicherung - Worst-Case-Analysis

This draft Technical Report is submitted to CEN members for Vote. It has been drawn up by the Technical Committee CEN/CLC/JTC 5.

CEN and CENELEC members are the national standards bodies and national electrotechnical committees of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a Technical Report. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a Technical Report.

Table of contents

European Foreword	4
1 Scope	5
2 References	6
3 Terms, definitions and abbreviated terms	7
3.1 Terms from other documents	7
3.2 Terms specific to the present document	7
3.2.1 ambient temperature	7
3.2.2 biased variation value	7
3.2.3 component parameters	7
3.2.4 component specification.....	7
3.2.5 design lifetime	7
3.2.6 effective ageing data	7
3.2.7 lifetime assumed in database	7
3.2.8 radiation	7
3.2.9 random variation value	8
3.2.10 reference condition.....	8
3.2.11 temperature assumed in database	8
3.2.12 variation factors.....	8
3.2.13 worst case.....	8
3.2.14 worst case analysis (WCA)	8
3.2.15 functional block	8
3.3 Abbreviated terms.....	8
4 General methodology	10
4.1 Introduction.....	10
4.2 Flow diagram of WCA.....	10
4.3 Identification of the critical aspects w.r.t. worst case performance	12
4.4 Evaluation of worst case performance	12
4.5 Comparison of WCA with requirements	13
5 Analysis parameters and technical issues	14

5.1 Definition of worst case parameters within parts database..... 14

 5.1.1 Variation factors 14

 5.1.2 Summary on deviations..... 18

5.2 Phase and timing considerations within the WCA 19

 5.2.1 Introduction 19

 5.2.2 Timing of transient pulses 19

5.3 Numerical analysis techniques..... 19

 5.3.1 Approach 19

 5.3.2 Extreme value analysis 20

 5.3.3 Extreme value analysis combined approach 20

 5.3.4 Root-sum-squared analysis..... 20

 5.3.5 Monte Carlo analysis..... 20

6 WCA and project phases 22

European Foreword

This document (FprCEN/TR 17602-30-01:2021) has been prepared by Technical Committee CEN/CLC/JTC 5 "Space", the secretariat of which is held by DIN.

It is highlighted that this technical report does not contain any requirement but only collection of data or descriptions and guidelines about how to organize and perform the work in support of EN 16602-30.

This Technical report (FprCEN/TR 17602-30-01:2021) originates from ECSS-Q-HB-30-01A.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN [and/or CENELEC] shall not be held responsible for identifying any or all such patent rights.

This document has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association.

This document has been developed to cover specifically space systems and has therefore precedence over any TR covering the same scope but with a wider domain of applicability (e.g.: aerospace).

This document is currently submitted to the CEN CONSULTATION.

1

Scope

This handbook provides guidelines to perform the worst case analysis. It applies to all electrical and electronic equipment. This worst case analysis (WCA) method can also be applied at subsystem level to justify electrical interface specifications and design margins for equipment. It applies to all project phases where electrical interface requirements are established and circuit design is carried out.

The worst case analysis is generally carried out when designing the circuit. For selected circuitry, worst case analysis (WCA) can be used to validate a conceptual design approach.

Terms, definitions and abbreviated terms

3.1 Terms from other documents

For the purpose of this document, the terms and definitions from ECSS-S-ST-00-01 apply and the terms specific to the present document.

3.2 Terms specific to the present document

3.2.1 ambient temperature

temperature of a medium surrounding the component

3.2.2 biased variation value

value with a deterministic direction or sign whose amplitude and direction of variation are known

3.2.3 component parameters

electrical performance parameters of EEE parts

3.2.4 component specification

specification of the EEE part used for procurement of the EEE part

3.2.5 design lifetime

duration for which the circuit is designed to work within a particular mission

3.2.6 effective ageing data

ageing data extrapolated from the lifetime assumed in database to the design lifetime

3.2.7 lifetime assumed in database

lifetime for which the parameter variation due to ageing and environmental effects is valid

3.2.8 radiation

phenomenon by which energy, in form of waves or particles, emanates from a source into space

Example Trapped electrons, trapped protons and solar protons.

FprCEN/TR 17602-30-01:2021 (E)**3.2.9 random variation value**

value with no preferred direction or sign whose amplitude alone is known

3.2.10 reference condition

relative condition where the parameter variation is assumed to be zero

3.2.11 temperature assumed in database

temperature for which the parameter variation is given in the database

3.2.12 variation factors

factors which affect component parameters over its lifetime

NOTE For details see subclause 5.1.1.

3.2.13 worst case

highest or lowest boundary value of a given control parameter established in a validation or qualification exercise

NOTE Failures or single event effects are not covered by the worst case.

iTeh STANDARD PREVIEW
(standards.iteh.ai)

3.2.14 worst case analysis (WCA)

performance prediction of the circuit in the worst case condition

3.2.15 functional block

within a circuit, set of components which perform a specific function

3.3 Abbreviated terms

For the purpose of this document, the abbreviated terms from ECSS-S-ST-00-01 and the following apply:

Abbreviation	Meaning
CDR	critical design review
EEE	electrical, electronic, electromechanical
EMC	electromagnetic compatibility
EOL	end-of-life
EVA	extreme value analysis
E _A	activation energy

k	Boltzmann constant
MCA	Monte-Carlo analysis
PCB	printed circuit board
PDF	probability density function
PDR	preliminary design review
RF	radio frequency
RSS	root-sum-square
SEE	single event effect
T_j	junction temperature
WCA	worst case analysis
