INTERNATIONAL ELECTROTECHNICAL COMMISSION

OPTICAL AMPLIFIERS –
TEST METHODS –
Part 1: Power and gain parameters

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as “IEC Publication(s)”). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 61290-1 has been prepared by subcommittee 86C: Fibre optic systems and active devices, of IEC technical committee 86: Fibre optics. It is an International Standard.

This second edition cancels and replaces the first edition published in 2014. This edition constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition:

- a) Specification of gain ripple as a new parameter;
- b) Specification of test method and test report for gain ripple measurements;
- c) Use of the term “measurement uncertainty” instead of “measurement accuracy”.

The text of this International Standard is based on the following documents:

Draft	Report on voting
XX/XX/FDIS	XX/XX/RVD

74
75 Full information on the voting for its approval can be found in the report on voting indicated in
76 the above table.

77 The language used for the development of this International Standard is English.

78 This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in
79 accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available
80 at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are
81 described in greater detail at <http://www.iec.ch/standardsdev/publications>.

82 The committee has decided that the contents of this document will remain unchanged until the
83 stability date indicated on the IEC website under webstore.iec.ch in the data related to the
84 specific document. At this date, the document will be

- 85 • reconfirmed,
86 • withdrawn,
87 • replaced by a revised edition, or
88 • amended.

iTeh STANDARD PREVIEW (standards.iteh.ai)

[oSIST prEN IEC 61290-1:2022](https://standards.iteh.ai/catalog/standards/sist/188a6601-886e-487b-82db-aa76bbca5c25/osist-pren-iec-61290-1-2022)

<https://standards.iteh.ai/catalog/standards/sist/188a6601-886e-487b-82db-aa76bbca5c25/osist-pren-iec-61290-1-2022>

90 **OPTICAL AMPLIFIERS –**
91 **TEST METHODS –**
92 **Part 1: Power and gain parameters**
93

94 **1 Scope**

95 This part of IEC 61290 applies to all commercially available optical amplifiers (OAs) and
96 optically amplified subsystems. It applies to OAs using optically pumped fibres (OFAs based on
97 either rare-earth doped fibres or on the Raman effect), semiconductors (SOAs), and
98 waveguides (POWAs). It is specifically directed to single-channel amplifiers. Test methods for
99 multichannel amplifiers are defined in the IEC 61290-10 series.

100 This standard establishes uniform requirements for accurate and reliable measurements of the
101 following OA parameters, as defined in Clause 3 of IEC 61291-1:

102 a) nominal output signal power;

103 b) gain;

104 c) reverse gain;

105 d) maximum gain;

106 e) maximum gain wavelength;

107 f) maximum gain variation with temperature;

108 g) gain wavelength band;

109 h) gain wavelength variation;

110 i) gain stability;

111 j) polarization-dependent gain;

112 k) gain ripple (SOA only);

113 l) large-signal output stability;

114 m) saturation output power;

115 n) maximum output signal power;

116 o) maximum total output power.

117 NOTE 1 The applicability of the test methods described in the present standard to distributed Raman amplifiers is
118 still under study.

119 NOTE 2 All numerical values followed by (‡) are suggested values for which the measurement is assured. Other
120 values are acceptable if verified.

121 **2 Normative references**

122 The following documents are referred to in the text in such a way that some or all of their content
123 constitutes requirements of this document. For dated references, only the edition cited applies.
124 For undated references, the latest edition of the referenced document (including any
125 amendments) applies.

133 **3 Terms, definitions and abbreviated terms**

134 **3.1 Terms and definitions**

135 For the purposes of this document, the terms and definitions given in IEC 61291-1 apply.

136 ISO and IEC maintain terminological databases for use in standardization at the following
 137 addresses:

- 138 • IEC Electropedia: available at <http://www.electropedia.org/>
- 139 • ISO Online browsing platform: available at <http://www.iso.org/obp>

142 FWHM full width at half maximum

143 OA optical amplifier

144 OFA optical fibre amplifier

145 OSA optical spectrum analyzer

146 POWA planar optical waveguide amplifier

147 SOA semiconductor optical amplifier

148 **4 Optical power and gain test method**

149 Three commonly practised procedures for quantifying the optical power and gain of an OA are
 150 considered in this standard.

151 The aim of the first procedure (see IEC 61290-1-1) is to determine the optical power and gain
 152 by means of the optical spectrum analyzer test method.

153 The aim of the second procedure (see IEC 61290-1-2) is to determine the optical power and
 154 gain by means of an optical detector and an electrical spectrum analyzer.

155 The aim of the third procedure (see IEC 61290-1-3) is to determine the optical power and gain
 156 by means of an optical power meter and an optical bandpass filter.

157 **5 Optical power and gain parameters**

158 The parameters listed below are required for gain and power:

- 159 a) Nominal output signal power: The nominal output signal power is given by the minimum
 160 output signal optical power for an input signal optical power specified in the relevant detail
 161 specification and under nominal operating conditions given in the relevant detail
 162 specification. To find this minimum value, input and output signal power levels shall be
 163 continuously monitored for a given duration of time and in presence of changes in the
 164 state of polarization and other instabilities, as specified in the relevant detail specification.
 165 The measurement procedures and calculations are described in each test method.
- 166 b) Gain: The measurement procedures and calculations are described in each test method.

- 167 c) Reverse gain: As in b), but with the OA operating with the input port used as an output
168 port and vice-versa.
- 169 d) Maximum gain: As in b), but use a wavelength-tuneable optical source and repeat all
170 procedures at different wavelengths in such a way as to cover the wavelength range
171 specified in the relevant detail specification.

172 Unless otherwise specified, the wavelength should be changed by steps smaller than 1 nm
173 (\pm) around the wavelength where the ASE spectral profile, observed (e.g. with an optical
174 spectrum analyzer or a monochromator) without the input signal, takes its maximum value.

175 NOTE 1 A wavelength measurement uncertainty of 0,01 nm, within the operating wavelength range of the OA,
176 is attainable with commercially available wavelength meters based on interference-fringes counting
177 techniques. Some tuneable external-cavity laser-diode instruments provide a wavelength measurement
178 uncertainty of 0,2 nm.

179 The gain values are measured at the different wavelengths as described in b) above. The
180 maximum gain shall be given by the highest of all these gain values at nominal operating
181 condition. Figure 1 shows the typical behaviour of the gain as a function of the input signal
182 power.

183

<https://standards.iteh.ai/catalog/standards/sist/188a6601-886e-487b-82db-aa76bbca5c25/osist-pren-iec-61290-1->

184

Figure 1 – Typical behaviour of the gain as a function of input signal power

- 185 e) Maximum gain wavelength: As in d), the maximum gain wavelength shall be the
186 wavelength at which the maximum gain occurs. Refer to Figure 2 for typical gain
187 behaviour for different wavelengths.

188

189

Figure 2 – Typical behaviour of the gain as a function of wavelength

190 f) Maximum gain variation with temperature: The maximum change of signal gain for a
 191 certain specified temperature range. The measurement procedures and calculations
 192 described below shall be followed, with reference to the measurement set-up and
 193 procedure for each test method:

- 194 1) As described in b), measure the maximum gain $G_{\max\text{-tmp}}$ within the variation of
 195 temperature, as specified in the relevant detail specification;
- 196 2) As described in b), measure the minimum gain $G_{\min\text{-tmp}}$ within the variation of
 197 temperature, as specified in the relevant detail specification;
- 198 3) Maximum gain variation with temperature ΔG_{tmp} is given by Formula (1):

$$\Delta G_{\text{tmp}} = G_{\max\text{-tmp}} - G_{\min\text{-tmp}} \text{ (dB)} \quad (1)$$

199 Refer to Figure 3.

200 Gain variation with temperature may depend on the signal wavelength, owing to its
 201 active fibre characteristics. The wavelength at which the parameter is specified and
 202 measured should be stated.

203

204 **Figure 3 – Typical behaviour of the gain as a function of temperature**

- 205 g) Gain wavelength band: Measure the maximum gain as described in d). Identify those
 206 wavelengths at which the gain is N dB below the maximum gain. The gain wavelength
 207 band shall be given by the wavelength interval(s) that comprise those wavelengths at
 208 which the gain is between the maximum gain value and the value N dB below the
 209 maximum gain. Calculations are processed according to the following procedure:
 - 210 1) Plot the gain at each wavelength as a function of wavelength, as shown in Figure 2;
 - 211 2) Draw a horizontal line N dB below the maximum gain value;
 - 212 3) The two or more intersection points of this line with the gain profile plotted in 1) yield
 213 two (or more) N -dB-down wavelengths, which define the range of the gain wavelength
 214 band. The wavelength interval with the minimum difference in N -dB-down wavelengths
 215 is the gain wavelength band.

216 NOTE 2 A value of $N = 3$ is typically applied.

- 217 h) Gain wavelength variation: Measure the maximum gain and minimum gain over the
 218 specified measurement wavelength range as described in d). The gain variation shall be
