INTERNATIONAL ELECTROTECHNICAL COMMISSION

**Smart grid - Application specification - Interface and framework for customer;
Interface between the CEM and Home/Building Resource manager
General Requirements and Architecture**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

The IEC 63402-1 ED1 has been prepared by subcommittee WG3: Customer Energy Management Systems, of IEC technical committee SC23K: Electrical Energy Efficiency products. It is an International Standard.

The text of this International Standard is based on the following documents:

Draft	Report on voting
XX/XX/FDIS	XX/XX/RVD

Note This standard applies to have the status of a group energy efficiency publication in accordance with IEC Guide 118 Edition 2

This document is currently submitted to the Enquiry.

The following dates are proposed:

- latest date by which the existence of this document has to be announced at national level (doa) dor + 6 months
- latest date by which this document has to be implemented at national level by publication of an identical national standard or by endorsement (dop) dor + 12 months
- latest date by which the national standards conflicting with this document have to be withdrawn (dow) dor + 36 months (to be confirmed or modified when voting)

131 INTRODUCTION

132 In traditional electricity networks, energy flows in one direction and communications from the generator
133 to the consumer is generally via the transmission and distribution systems.

134 Although there is some monitoring and control of equipment in the transmission and distribution systems,
135 there is no communication with, or control of, consumer equipment. In particular, there is no means of
136 requesting short-term control of consumer equipment to match the prevailing generation and/or
137 transmission/distribution grid conditions. Generation equipment is controlled to match the open-ended
138 (uncontrolled) demand of the consumer.

139 Today we are faced with an increase of energy consumption, this is directly linked to an increase of CO₂
140 production. The increased CO₂ density in the atmosphere supports the climate warming of the earth.

141 One significant way to cope with the increased energy consumption without increasing the CO₂
142 production is to use more renewable energy resources.

143 Unfortunately, the available renewable energy supply is not aligned with the energy demand. To
144 increase efficiency, the energy demand should be aligned as much as possible with the available energy
145 supply. The future grid will become generation led rather than demand led as it is today. In order to
146 reach this goal, communications between the various equipment and systems of the stakeholders within
147 the energy field is necessary. This new form of grid which exchanges information and energy between
148 producers, consumers, distributors and metering is known as the "Smart Grid".

149 The IEC 63402 series describes aspects of this smart grid that relate specifically to the premises
150 (home/building) part of the smart grid, including the common interface between equipment in the
151 premises and the smart grid.

<https://standards.iteh.ai/catalog/standards/sist/1381d33a-67cf-4394-8bd3-6bd5b8c6b917/osist-pren-iec-63402-1-2024>

154 **1 Scope**

155 This document General Requirements and Architecture of an application layer interface between the
156 Point of common coupling (PCC) and Smart Devices (SD) operating within the smart grid premises-side
157 system (i.e. residential / commercial but not industrial premises).

158 This standard does not include requirements for:

159 – Safety;

160 – EMC;

161 – Data security; it is assumed that the underlying protocols will take the data security aspect into account;

162 Note: Although data security is not within the scope of this standard, clause 4 provides some high-level design guidelines for
163 data security.

164 – Special equipment (e.g. legacy heat pumps) with a direct physical connection to the grid, as such equipment
165 bypasses the CEM and is not HBES/BACS enabled (covered by other standards than the IEC 63402 series).

166 **2 Normative references**

167 The following documents are referred to in the text in such a way that some or all of their content
168 constitutes requirements of this document. For dated references, only the edition cited applies. For
169 undated references, the latest edition of the referenced document (including any amendments) applies.

170 EN 50491-12 (all parts), *General requirements for Home and Building Electronic Systems (HBES) and Building
171 Automation and Control Systems*

172 IEC63110-1 *Protocol for management of electric vehicles charging and discharging infrastructures - Part 1:
173 Basic definitions, use cases and architectures*

174

175 **3 Terms, definitions and abbreviations**

176 **3.1 Terms and definitions**

177 For the purposes of this document, the following terms and definitions apply:

178 **3.1.1**

179 **Customer Energy Manager**

180 **CEM**

181 internal automation function for optimizing the energy consumption, production and storage within the premises
182 according to the preferences of the customer using internal flexibilities and typically based on external information
183 received through the Energy Management Gateway and possibly other data sources

184 **3.1.2**

185 **Customer Energy Manager System**

186 **CEM system**

187 allows the management of energy consumption, production and storage within the premises, consisting of a CEM
188 connected to one or more Resource Managers which themselves act as gateways to HBES / BACS, SASS and
189 / or Smart Appliances

190

191 **3.1.3**

192 **Energy Management Gateway**

193 **EMG**

194 access point (functional entity) sending and receiving smart grid related information and commands between an
195 actor in the Grid and the CEM, letting the CEM decide how to process the events

196 Note to entry: The communication is often ensured through an internet connection.

- 197 **3.1.4**
 198 **Building Energy Management**
 199 **BEM**
 200 internal automation function for observing the Point of common coupling (PCC), to avoid an overload of the PCC
 201 and share the available energy between the different Sub systems which are represented by the connected
 202 CEM's. The BEM gets additional information (Voltage, Frequency, Cos Phi) from a Grid observer which allows
 203 to support the grid even in the case the IP communication is broken.
- 204 Note to entry: BEM is also called sometimes Facility Energy Manager (FEM)
- 205 **3.1.5**
 206 **Head End System**
 207 **HES**
 208 system that receives metering data in the advanced metering infrastructure
- 209 **3.1.6**
 210 **Home and Building Electronic Systems / Building Automation Control Systems**
 211 **HBES / BACS**
 212 logical group of devices which uses a multi-application communication system where the functions are distributed
 213 and linked through a common communication process
- 214 Note 1 to entry: HBES/BACS is used in homes and buildings plus their surroundings. Functions of the system are e.g.:
 215 switching, open loop controlling, closed loop controlling, monitoring and supervising.
- 216 Note 2 to entry: In literature, HBES/BACS may be referred also as "home control system/network", "home electronic
 217 systems" "building automation systems" etc.
- 218 Note 3 to entry: Examples of HBES/BACS applications are the management of lighting, heating, energy, water, fire alarms,
 219 blinds, different forms of security, etc.". See introduction in EN 50491-4-1.
- 220 **3.1.7**
 221 **Schema**
 222 abstract model that documents and organizes the data required in a defined way, so it can be used for different
 223 purposes such as exchanging and / or storing information
- 224 **3.1.8**
 225 **Meter Data management**
 226 **MDM**
 227 software system that performs long-term data storage and management for the vast quantities of data delivered
 228 by smart metering systems
- 229 **3.1.9**
 230 **Resource Manager**
 231 function that exclusively represents a logical group of devices or a single smart device, and is responsible for
 232 sending unambiguous instructions to the logical group of devices or to a single device, typically using a device-
 233 specific protocol
- 234 Note 1 to entry: In the context of this document the Resource Manager manages the energy flexibility of a logical group of
 235 devices or a single smart device.
- 236 Note 2 to entry: The Resource Manager may be implemented in a special device, in the smart device itself or outside of the
 237 device
- 238 **3.1.10**
 239 **premises**
 240 can be a public or private building/home where energy is used and/or produced
- 241 **3.1.11**
 242 **Smart Appliance**
 243 device that consumes energy that can be controlled by a Resource Manager, such as a washing
 244 machine, a freezer, a dishwasher

245 **3.1.12**246 **Smart Device**247 **SD**

248 device that can consume, produce or store energy (or a combination thereof) and that can be controlled
 249 by a Resource Manager for the purpose of energy management, such as a lighting controller, an electric
 250 vehicle, a smart appliance, a renewable power source, an energy storage system

251 **3.1.13**252 **Single Application Smart System**253 **SASS**

254 group of devices having a communication interface for a single application such as heating or lighting,
 255 that consume, produce or store energy (or a combination thereof) and that can be controlled by a
 256 Resource Manager for the purpose of energy management

257 **3.1.14**258 **Aggregator**

259 party who contracts with a number of other network users (e.g. energy consumers) in order to combine the effect
 260 of smaller loads or distributed energy resources for actions such as demand response or for ancillary services

261

262 **3.1.15**263 **Point of Common Coupling (PCC)**

264 point of common coupling PCC - point in an electric power system, electrically nearest to a particular
 265 load, at which other loads are, or may be, connected

266 Note 1 to entry: These loads can be either devices, equipment or systems, or distinct network users'
 267 installations

268 Note to entry: Point Of Common coupling is equal to Grid connection Point

269

270 **3.1.16**271 **Point of common coupling monitor**

272 Measures the Voltage, Frequency, Current at the PCC and sends this information to the BEM

273 **3.1.17**274 **Energy Management System**275 **EMS**

276 is a Hardware with different functions included according to the system requirements. Every underlying
 277 subsystem, to be connected to the EMS, is connected via the RM function. A minimum EMS consists of
 278 a CEM and at least one RM.

279 **3.1.18**280 **Energy Metering Service Provider**

281 party providing energy metering services

282

283 **3.1.19**284 **Distribution System Operator (DSO)**

285 securely operates and develops an active distribution system comprising networks, demand, generation and
 286 other flexible distributed energy resources

287

288 **3.1.20**289 **Energy Service Provider**

290 party providing energy (utility) or energy services (Aggregator, E-mobility Service provider, etc)

291

292

293 **3.2 Abbreviations**

BACS Building Automation Control Systems

BEM Building Energy Manager (sometimes also called FEM)
