## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: **Error! Hyperlink reference not valid.**

The committee responsible for this document is ISO/TC 37, *Language and Terminology*, Subcommittee SC 4, *Language resource management*

ISO 24617 consists of the following parts under the general title *Language resource management — Semantic annotation framework (SemAF)*:

- Part 1: Time and events (TimeML)
- Part 2: Dialogue acts (DA)
- Part 3: Named entity
- Part 4: Semantic roles (SR)
- Part 5: Discourse structures (DS)
- Part 6: Principles of semantic annotation (SemAF Principles)
- Part 7: Spatial information
- Part 8: Semantic relations in discourse, core annotation schema (DR-core)
- Part 9: Reference annotation framework (RAF)
- Part 10: Visual information (VoxML)
- Part 11: Measurable quantitative information (MQI)
- Part 12: Quantification
- Part 13: Gestures

## Introduction

Measurable quantitative information (MQI) such as ‘165 cm’ or ‘60 kg’ of ‘John’ that applies to the height or weight of the person is very common in ordinary language. MQI describes one of basic properties which is associated with the magnitude aspect of quantity. Such information is much more abundant in scientific publications or technical reports to the extent that it constitutes an essential part of communicative segments of language in general. The processing of such information is thus required for any successful language resource management.

This document, named ‘SemAF-MQI’, thus aims to focus on specifying a general annotation scheme with following the principles of semantic annotation laid down in ISO 24617-6 in general and the basic requirements of ISO 24611 Linguistic annotation framework (LAF), that facilitates the processing of MQI in scientific and technical language and to make it interoperable with other semantic annotation schemes, such as ISO 24617 etc.

NOTE 1 ISO 24617-1:2012 (E) TimeML and ISO 24617-7: 2014 (E) Spatial information, for instance, have proposed a way of annotating measures on time (durations or time amounts) and space (distances), respectively. The serious discussion of annotating measures as part of ISO 24617 was initiated at the 11<sup>th</sup> joint ACL-ISO/TC 37/SC 4/WG 2 Workshop on Interoperable Semantic Annotation (ISA-11)<sup>[1]</sup> and was continued at the ISA-13<sup>[2]</sup>, ISA-14<sup>[3]</sup>, and ISA-15<sup>[4]</sup> workshops. ISO 24612: 2012 (E) LAF provides a pivotal form (GrAF, graphic annotation framework) that makes all the annotation of temporal or spatial measures in these two annotation schemes interchangeable with those measure annotations in the new document SemAF-MQI.

Focusing on measurements in scientifico-technological language, SemAF-MQI as an ISO standard is expected to contribute to information extraction (IR)<sup>[5]</sup>, question answering (QA), text summarization (TS), and other natural language processing (NLP) applications<sup>[6]</sup>.

NOTE 2 To enhance the readability of this document and to correct some obvious editorial errors, some editorial changes were made on the earlier version of CD 24617-11 MQI that had been submitted to the successful CD ballot (2019-09-11 ~ 2019-11-06) with a 100% approval but with no comments.

- Each item in Bibliography as well as in [Clause 2](#) Normative references was made to be referred to in the main part of the current version of the document.
- Three of the illustrative examples in clause 7.6 Illustrations of QML\_csx were moved to a newly created [Annex A](#) (informative) without any change of content change in order to lighten the burden of reading that clause 7.6.
- Incorrect wordings or obvious typos were corrected.
- The white and black coloring of [Figure 1](#) — Metamodel of QML was changed to the multiple coloring to bring out each of the different components of the metamodel.

# Language resource management — Semantic annotation framework (SemAF) —

## Part 11: Measurable Quantitative information (MQI)

### 1 Scope

As one of the basic physical properties, quantity is associated with multitude (how many) and magnitude (how much). Focusing on the magnitudinal aspect of quantity, this document, which is named “SemAF-MQI” henceforth, aims at formulating a specification language for the construction of an annotation scheme for measurable quantitative information (MQI) in scientifico-technological language. The main characteristics of SemAF-MQI is that quantitative information is presented as measures expressed in terms of a pair  $\langle n, u \rangle$ , consisting of a numerically expressed quantity  $n$  and a unit  $u$ , which is either basic or derived, or either normalized or conventionally used.

NOTE 1 MQI stands for “measurable quantitative information”, whereas SemAF-MQI refers to the part 11 of ISO 24617-11. [See 3.4 for the definition of MQI.]

The scope of SemAF-MQI is restricted to the measurable or magnitudinal aspect of quantity so that it can focus on the technical or practical use of measurements in IR (information retrieval), QA (question answering), TS (text summarization), and other NLP (natural language processing) applications. The scope is restricted to the domains of technology that carry more applicational relevance than some theoretical issues found in the ordinary use of language. The subsequent part of ISO 24617 (Part 12) deals with more general and theoretical issues of quantification and quantitative information.

NOTE 2 The scope of this document is intentionally restricted to the measurable or magnitudinal aspect of quantity so that SemAF-MQI focuses on the technical or practical use of measurements in IR, QA, TS, and other NLP applications. The scope is restricted to domains of technology that carry more applicational relevance than theoretical issues found in the ordinary use of language. Fruit as well as meat is, for instance, sold at markets in terms of weight but not of pieces. Furthermore, the subsequent part of ISO 24617 (Part 12) deals with more general and theoretical issues of quantification and plurals (e.g., “three apples) including quantitative information that includes multitudinal aspects.

The scope of SemAF-MQI also treats temporal durations that are discussed in Part 1 of ISO 24617 SemAF-Time (ISO-TimeML) and spatial measures such as distances that are treated in Part 7 of ISO 24617 Spatial information (ISO-Space), while making them interoperable with other measure types. It also accommodates the treatment of measures or amounts that are introduced in ISO 24617-6 SemAF Principles (Clause 8.3).

NOTE 3 The scope of this document (Part 11) also treats temporal durations that are discussed in Part 1 of ISO 24617 SemAF-Time (TimeML) and spatial measures such as distances that are treated in Part 7 of ISO 24617 Spatial information, while making them interoperable with other measure types. It also accommodates the treatment of measures or amounts that are introduced in ISO 24617-6 SemAF Principles. Its scope thus covers temporal durations treated in XSchema and the TEI Guidelines.

### 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

NOTE 1 The following two documents are de-facto standards to be followed by SemAF-MQI:

TEI P5: Guidelines for Electronic Text Encoding and Interchange, The TEI Consortium, 2019<sup>[7]</sup>.

XML Schema, Part 2: Datatypes, 2nd edition, W3C Recommendation, 28 October 2004<sup>[8]</sup>.

**3 Terms and definitions**

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

— IEC Electropedia: available at <http://www.electropedia.org/>

— ISO Online browsing platform: available at <https://www.iso.org/obp>

**3.1****quantity**

property of a measurable object referring to its magnitude (how much) or multitude (how many).

Note 1 to entry: Compare with ISO 80000-1:2009, 3 Terms and Definitions, 3.1: property of a phenomenon, body, or substance, where the property has a magnitude that can be expressed by means of a number and a reference.

**3.2****base quantity**

quantity in a conventionally chosen subset of a given system of quantities, where no quantity in the subset can be expressed in terms of the other quantities within that subset

Note 1 to entry: Kinds of quantities include seven base quantities defined by the International System of Quantities (ISQ), as listed in [Table 1](#)

**Table 1 — ISQ base quantities**

base quantities	base quantity symbols
length	L
mass	M
time	T
electric current	I
thermodynamic temperature	$\theta$
amount of substance	N
luminous intensity	J

Note 2 to entry: In ISO 80000-1:2009, 3 Terms and Definition, the symbols such as L and M, which are called base quantity symbols in this document, are called as dimension symbols of quantity

**3.3****derived quantity**

quantity, in a system of quantities, defined in terms of the base quantities of that system

EXAMPLE Speed is a derived quantity defined by length (distance) over time ( $LT^{-1}$ ), where length (L) and time (T) are base quantities.

[SOURCE: ISO 80000-1:2009, 3 Terms and Definition, [3.5](#) derived quantity]

**3.4****quantitative information****QI**

measure associated with the quantity ([3.1](#)) of a measurable object

**3.5****measurable quantitative information****MQI**

quantitative information ([3.3](#)) that can be expressed in unitized numeric terms

**3.6****measurable quantitative information markup language****markup language of measurable quantitative information****QML**

specification language for the annotation of measurable quantitative information ([3.5](#)) extractable from text or other medium types of language

**3.7****unit****unit of measurement****measurement unit**

scalar basis, defined and adopted by convention, of measuring objects by multiplying their quantitative values expressed in real numbers

**iTeh STANDARD PREVIEW**  
(standards.iteh.ai)

oSIST ISO/DIS 24617-11:2021  
<https://standards.iteh.ai/catalog/standards/sist/dd3653d8-71c7-4caa-a7d9-502ca18714db/osist-iso-dis-24617-11-2021>

Note 1 to entry: The expressions that are used in measurement such as “meter”, “liter”, and “ $\mu\text{mol/kg}$ ” are units by the definition given above. The multitude expressions such as “bottles”, “boxes”, or “two” as in “two bottles of milk”, “a box of apples”, and “two coffees” sometimes fail to be regarded as units, but they can also be if they are accepted as units by convention or agreement in some communities. ISO 24617 SemAF Part 12: Quantification treats such multitude expressions as genuine units.

Note 2 to entry: There are two major types of units, base and derived

[Refer to ISO 80000-1:2009, 3 Terms and Definitions, [3.9](#) Unit, 3.10 Base unit, and 3.11 Derived unit.]

[SOURCE: Refer to: ISO 80000-1:2009, 3 Terms and Definitions, [3.9](#), real scalar quantity, defined and adopted by convention, with which any other quantity of the same kind can be compared to express the ratio of the second quantity to the first one as a number.]

**3.8****base unit**

measurement unit that is adopted by convention for a base quantity ([3.2](#))

Note 1 to entry: There are seven base units chosen by the International System of Units (SI) associated with seven ISQ base quantities to measure quantities, as shown in [Table 2](#).

**Table 2 — base units**

SI base unit (unit symbol)	Associated ISQ base quantity (base quantity dimension symbol)
meter (m)	length (L)
kilogram (kg)	mass (M)

**Table 2** (continued)

SI base unit (unit symbol)	Associated ISQ base quantity (base quantity dimension symbol)
second (s)	time (T)
ampere (A)	electric current (I)
kelvin (K)	thermodynamic temperature (Θ)
mole (mol)	amount of substance (N)
candela (cd)	luminous intensity (J)

[SOURCE: ISO 80000-1:2009, 3 Terms and Definitions, 3.9 Unit, 3.10 Base unit, and 3.11 Derived unit.]

**3.9 derived unit**

measurement unit for a derived quantity

EXAMPLE The unit “newton” (N) is a derived unit for a derived quantity “force” (F), which is defined to be “mass times acceleration” (MLT<sup>-2</sup>), where the quantity “acceleration” is a derived quantity defined by “velocity divided by time” (VT<sup>-1</sup>) and “velocity” defined by “length (distance) divided by time” (LT<sup>-1</sup>).

Note 1 to entry: Table 3 illustrates some of the derived units.

[Refer to ISO 80000-1:2009, 3 Terms and Definitions, 3.9 Unit, 3.10 Base unit, and 3.11 Derived unit.]

**Table 3 — derived units**

Derived unit (unit symbol)	Associated derived quantity
kilo-meter per minute (km/min)	speed = length(L)/ time(T)
gram per cubic meter (gram/m <sup>3</sup> )	density = mass(M)/volume(L <sup>3</sup> )
kilo- gram, meter per square second (kg x m/s <sup>2</sup> )	force = mass (M) x length(L)/time(T <sup>2</sup> )
lumen per square meter (lm/m <sup>2</sup> )	Illuminance = luminous intensity (J)/ area(M <sup>2</sup> )

**4 Background and Motivations**

Quantity exists as a multitude (e.g., “two watermelons”) or magnitude (“one kilogram of watermelon”). The two basic divisions of quantity imply the principal distinction between continuity (continuum) and discontinuity, which are two ways of determining quantity. SemAF-MQI only focuses on the measurement information in scientific and technical texts. Therefore, quantity is regarded as a magnitude property in the document, which is consistent with ISO 80000 - 1:2009 Quantities and units. As in ISO 80000-1:2009, the term “unit” is defined in relation to quantity and is used for real scalar quantity, defined and adopted by convention, with which any other quantity of the same kind can be compared to express the ratio of the second quantity to the first one as a number. There are two types of units: base unit and derived unit.

This document treats complex derived units as unanalyzed wholes. It does not annotate their internal structures and components, unless it is required by some special use cases. Neither does the standard require to specify ways of converting one unit to another. Here are some reasons:

- 1) Complex derived units such as speed “km/h” (LT-1) or acceleration “m/s<sup>2</sup>” (LT-2) are understood as they are in ordinary situations.
- 2) Certain domain specific units cannot be decomposed during their conversion to other equivalent units. For example, Estimated Glomerular Filtration Rate (eGFR) frequently uses the unit “mL/min/1.73m<sup>2</sup>” in a medical domain. Thus, a kidney function can be classified into various stages
