THIS DOCUMENT IS A DRAFT CIRCULATED FOR COMMENT AND APPROVAL. IT IS THEREFORE SUBJECT TO CHANGE AND MAY NOT BE REFERRED TO AS AN INTERNATIONAL STANDARD UNTIL PUBLISHED AS SUCH.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

This document is circulated as received from the committee secretariat.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 299 WG 3, *Robotics – Industrial Safety*.

This second edition cancels and replaces the first edition (ISO 11593:1996), which has been technically revised.

The main changes compared to the previous edition are as follows:

- Normative References
- Introduction and Scope
- Terms & Definitions
- Added Safety Aspects in Annex A

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

ISO 11593 is one of a series of standards dealing with the requirements of robots for industrial environments.

Automatic exchange systems for end effectors increase in importance for handling devices.

This International Standard contains the vocabulary and presentation of characteristics, e.g. forces, moments (torques), and exchange times, for end effector exchange systems. This International Standard does not contain any details for the development and design of these systems.

Robots for industrial environments — Automatic end effector exchange systems — Vocabulary and presentation of characteristics

1 Scope

This standard defines terms relevant to automatic end effector exchange systems used in combination with industrial robots as defined in 10218-1:2006 and as parts of robot systems as defined in 10218-2:2006.

The terms are presented by their symbol, unit, definition and description. The definition includes applicable references to existing standards.

Annex A provides Examples of useful technical data of automatic end effector exchange systems.

3 Terms and definitions

For the purposes of this document, the definitions given in ISO 8373:2012 apply.

3.1 General Terms and Definitions

3.1.1

Automatic end effector exchange system

coupling device between the mechanical interface and the end effector enabling automatic exchange of end effectors, made up of a robot-mounted part and one or more tool-mounted parts.

NOTE Also referred to as a tool changer, quick-change device, automatic tool changer, robotic tool changer, or robot coupler.

3.1.2

Robot Mounted Part

part of a automatic end effector exchange system that is attached to the mechanical interface of a manipulator.

NOTE Also referred to as master or robot side.

3.1.3

Tool Mounted Part

part of a automatic end effector exchange system that is attached to the end effector.

NOTE Also referred to as slave or tool side.

3.1.7

Couple

the joining of the robot-mounted part to the tool-mounted part.

3.1.8

Uncouple

the releasing of the tool-mounted part from the robot-mounted part.

3.1.9

Lock

the actuation of the locking elements to connect the robot-mounted part to the tool-mounted part.

3.1.10

Unlock

the actuation of the locking elements to disconnect the tool mounted part from the robot mounted part.

3.1.5

Dock

the process of coupling and locking the robot mounted part to the tool mounted part when the tool-mounted part is held in the magazine.

3.1.6

Undock

the process of unlocking and uncoupling the tool-mounted part from the robot-mounted part where the tool-mounted part is held in the magazine.

3.1.4

Magazine

tool storage device to repeatably dock and undock for temporary storage an end effector and associated tool side.

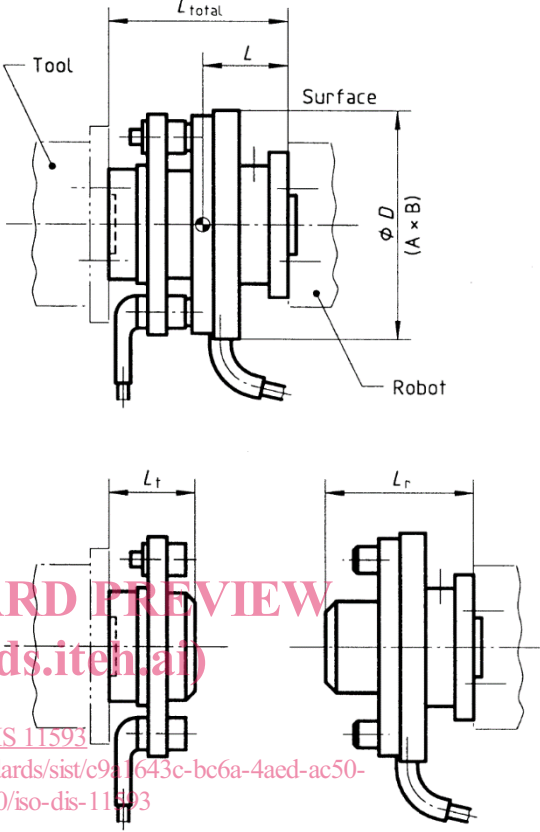

NOTE Also referred to as tool stand or tool storage rack, or nest.

3.1.1 Detailed Terms and Definitions

No.	Term	Symbol	Unit	Definitions and description
3.1 External shape and main dimensions of the exchange system				
3.1.1	structural shape	D A B L_r L_t	mm mm mm mm mm	 <p>The figure shows three technical drawings of the exchange system. The top drawing is a side view showing the 'Tool' and 'Robot' interfaces. It labels the total length as L_{total}, the length of the robot-mounted part as L, and the external diameter as ϕD (where $A \times B$ is also indicated). The bottom left drawing shows the length of the tool-mounted part as L_t. The bottom right drawing shows the length of the robot-mounted part as L_r.</p> <p>Overall dimensions of device:</p> <ul style="list-style-type: none"> external diameter (for circular shape) width 3.1 (for other) depth length of the individual robot-mounted part length of the individual tool-mounted part
3.1.2	face-to-face dimension	$L_{total} \pm \Delta$ $L_{cr} \pm \Delta$ $L_{ct} \pm \Delta$	mm mm mm	Distance measured from the robot interface to the tool interface: <ul style="list-style-type: none"> length of the coupled systems; coupling length of the robot part; coupling length of the tool part. <p>The tolerance of the length L_{cr} and L_{ct} has a significant effect on the pose accuracy of the complete system when using different tools.</p>
3.1.3	centre of gravity in the coupled system	L_g	mm	Distance of the centre of gravity in the coupled system from the reference plane of the mechanical interface of the robot.
