This document is not an ASTM standard and is intended only to provide the user of an ASTM standard an indication of what changes have been made to the previous version. Because it may not be technically possible to adequately depict all changes accurately, ASTM recommends that users consult prior editions as appropriate. In all cases only the current version of the standard as published by ASTM is to be considered the official document.

Designation: D2684-95 (Reapproved 2005) Designation: D2684 - 10

Standard Test Method for Permeability of Thermoplastic Containers to Packaged **Reagents or Proprietary Products¹**

This standard is issued under the fixed designation D2684; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope*

1.1 This test method covers procedures for determining the permeability of thermoplastic containers to packaged reagents or proprietary products under specified conditions of exposure. The exposures used are intended to simulate the normal and elevated temperature-storage conditions that might be encountered in end-use application.

1.2 This test method is applicable only to those types of containers designed to allow positive, leakproof closure.

1.3 Two procedures are provided:

1.3.1 Procedure A is specific to testing only with a standard design container. This procedure provides for determinations of rate of weight loss (or gain) and for calculation of a permeability factor.

1.3.2 *Procedure B* applies to tests of all other container designs. Permeability data by this procedure are expressed only in terms of rate of weight loss (or gain) for the particular container tested.

1.4The values stated in SI units are to be regarded as standard.

1.4 The values stated in SI units are to be regarded as standard. The values given in parentheses are mathematical conversions to inch-pound units that are provided for information only and are not considered standard.

NOTE 1-There is no known ISO equivalent to this standard.

1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

D1505 Test Method for Density of Plastics by the Density-Gradient Technique E145 Specification for Gravity-Convection and Forced-Ventilation Ovens

3. Terminology

3.1 Definitions:

3.1.1 permeability factor, P_t —the permeability of a given plastic to a given product at temperature t, in degrees Celsius, expressed in units of $g \cdot cm/day \cdot m^2$, as determined by Procedure A. The permeability factor under 23°C test conditions, for example, is signified by the notation P_{23} .

3.1.2 Determination of P_i is based on an averaged wall thickness over the entire area of the container and an assumption that permeation rate is inversely proportional to the thickness. Precaution in the extent of allowable variations of these factors is recommended, and the user of P, should take into consideration needs to recognize that wall thickness of the containers varies, that the estimate of average thickness from density, area, and weight is not exact, and that permeability of the product through the plastic material may not beis, generally, not directly proportional to the thickness.

*A Summary of Changes section appears at the end of this standard.

4. Summary of Test Method

4.1 Test bottles are filled with the test product and, after sealing, are exposed at 23° C (73.4° F) and 50° C (122° F) conditions for 28 days or longer. Measurements of weight are made at intervals to determine the average rate of weight change.

5. Significance and Use

5.1 With the proper precautions and background experience, results can be useful for estimation of the loss of a packaged product through the walls of a container during shelf storage. The test is also useful for isolating the effects of a container design and materials, and is applicable for development and research and for specification purposes.

5.2 In the absence of adequate supporting data, extrapolations or correlations of results to conditions beyond those of the test are not recommended because of possible product alteration, solvency, or chemical effects on the plastic, etc.

5.3 Before proceeding with this test method, reference should be maderefer to the specification of the material being tested. Any test specimen preparation, conditioning, dimensions, or testing parameters, or combination thereof, covered in the materials specification shall take precedence over those mentioned in this test method. If there are no material specifications, then the default conditions apply.

6. Apparatus

6.1 *Enclosure* or room with provision for maintaining the standard laboratory atmosphere of $23 \pm 2^{\circ}$ C (73.4 \pm 3.6°F) and 50 $\pm \frac{5\%10\%}{10\%}$ relative humidity, as defined by Practice D618.

6.2 *Circulating-Air Oven*, consistent with ovens in accordance with Specification E145, capable of maintaining a temperature of $50 \pm 1^{\circ}$ C ($122 \pm 1.8^{\circ}$ F) and an airflow rate of 8.5 to 17.0 m³/min (300 to 600 ft³/min). The limitation of 25 ft³ on oven size can be overlooked, provided all other requirements are met.

Note2—Only_2—The use of explosion-proof equipment with provision for adequate exhaust of vapors should be used is recommended for tests with potentially hazardous or toxic products.

NOTE 3—Relative humidity variation can significantly affect permeability loss in many products, especially water-based products in various thermoplastics. Therefore, the user may find For these purposes, it useful to equipis recommended that the oven be equipped with a means to measure relative humidity and to record the same during the period of test.

6.3 Balance, accurate to 0.01 % of the weight of test container and contents.

6.4 *Container Seals*, suitable heat-sealing laminate³ and polyethylene or other suitably lined screw-type closures for sealing the containers.

6.5 Heat Sealer.

6.6 Torque Wrench.

7. Reagents and Materials

7.1 The reagent or proprietary product as specified for testing. 2684-10

8. Test Specimens de la catalog/standards/sist/f87b0782-2740-4fb5-b586-b79f9d1cc9fa/astm-d2684-10

8.1 The test specimen for Procedure A shall be the 4-oz cylindrical bottle design as specified in Fig. 1, having a nominal external surface area of 154 $\text{cm}^2(23.8 \text{ in.}^2)$.

8.2The test specimen for Procedure B may be any thermoplastic container, as specified or selected for test evaluation, provided it is designed to allow positive closure.

8.2 Any thermoplastic container, as specified or selected for test evaluation, can be used for Procedure B provided it is designed to allow positive closure.

8.3 For each procedure, a minimum of three specimens shall be tested at each temperature. Three additional specimens are required for Procedure A for determination of the plastic density. Note4—Trim

<u>8.4 If necessary, trim</u> and finish the containers, if needed, containers to ensure a smooth contacting surface for positive seal.

9. Conditioning

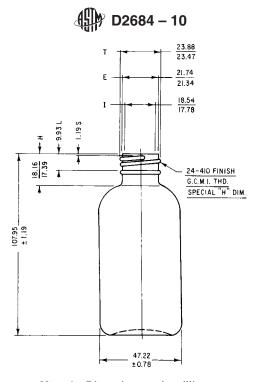

9.1 Conditioning—Condition the test specimens at $23 \pm 2^{\circ}$ C (73.4 $\pm 3.6^{\circ}$ F) and $50 \pm \frac{5\%10\%}{10\%}$ relative humidity for not less than 40 h prior to test in accordance with Procedure A of Practice D618, for those tests where conditioning is required. In cases of disagreement, the tolerances shall be $\pm 1^{\circ}$ C ($\pm 1.8^{\circ}$ F) and $\pm 2\% \pm 5\%$ relative humidity.

9.2 Test Conditions—Conduct tests in the standard laboratory atmosphere of $23 \pm 2^{\circ}C$ (73.4 \pm 3.6°F) and $50 \pm \frac{5\%10\%}{10.6\%}$ relative humidity, unless otherwise specified in the test methods. In cases of disagreements, the tolerances shall be $\pm 1^{\circ}C (\pm 1.8^{\circ}F)$ and $\frac{\pm 2\% \pm 5\%}{10.6\%}$ relative humidity.

10. Procedure A (Standard Container)

10.1 With specimens taken from the sidewalls of three of the containers, determine the average plastic density by Test Method

³ One such laminate suitable for polyethylene containers, MIL-B-131C Class 2, a polyethylene-aluminum foil-paper laminate available from the Robertson Co., Jamaica, NY. Heat sensitive seals are also available from 3M Packaging Systems Division, 3M Center Building 220-8W-01, St. Paul, MN, 55144.

NOTE 1—Dimensions are in millimetres. FIG. 1 Standard Container for Permeability Test

D1505, or by an alternative method of equivalent accuracy.

10.2 For each test temperature, select a minimum of three containers. Weigh each when empty, without the closure and laminate pieces. Also weigh the empty containers with their corresponding closures and appropriately sized laminate pieces.

10.3 Fill the containers to nominal capacity with the test product.

10.4 Make a thorough check for any drippage or spill of product on the outside surface of the containers. If any is noted, replace the container with a new specimen.

10.5 Heat seal the containers with the laminate (plastic to plastic), check for leaks, and then cap the containers with screw-type closures, using sufficient torque to provide positive seal. Avoid distorting the container when capping.

Note5—One 4—One method of testing for a poor seal is to immerse an upright test container in a beaker filled to the base of the cap with a liquid that will not attack the plastic. When a vacuum of 15 in. Hg is applied to the entire system, a poorly sealed bottle will give off bubbles from the sealed area.

Note<u>6—Any 5—Any</u> deformation of the container during sealing may result in a volume change which will affect the final test pressure. An application torque of 1.7 N·m (15 lbf·in.) has been found sufficient for the standard container in Fig. 1.

10.6 Weigh the sealed containers.

10.7 Unless otherwise specified, expose one set of containers in the Standard Laboratory Atmosphere, $23 \pm 2^{\circ}C$ (73.4 \pm 3.6°F) and 50 \pm 5%<u>10</u>% relative humidity, and another set in a circulating-air oven controlled at 50 \pm 1°C (122 \pm 1.8°F). Place the containers upright on an inert metal screen or perforated sheet support to allow air circulation. Place a tray beneath the container support to collect leakage of product, if failure occurs. Provide enough spacing between the containers so they do not touch each other. Also, take precautions as necessary to prevent any possible cross-contamination in the test chamber from other agents.

NOTE7-For_6-For_certain relatively unstable or spoilable products, the use of elevated temperature exposures may not be applicable.

10.8 Weigh the containers after 1 day, 7 days, 14 days, 21 days, and 28 days. In certain cases, If a steady rate of weight change may be is reached in either a shorter or longer period. Other period, other regular intervals can then be used. They should be regular_used and reported.

10.8.1 If the weight change appears abnormal for any of the containers during exposure, inspect the containers to ensure that a positive seal exists. If a leak is detected, retest with a new specimen.

10.8.2 CAfter removal from the oven, cool the container in the standard laboratory atmosphere until consistent weighings are obtained. Resume oven exposure within 6 h from removal time.

10.8.3 In elevated-temperature tests, rotate the locations of the specimens in the oven when re-exposing after each interval to minimize possible bias due to variations of airflow and temperature within the oven.

10.9 *Calculation*:

10.9.1 Calculate the percentage weight loss or gain after a given exposure time as follows:

Weight loss (at time x), $\% = [(G_u - G_x)/N_u] \times 100$
