

Designation: E1143 – 05(Reapproved 2010)

# Standard Test Method for Determining the Linearity of a Photovoltaic Device Parameter with Respect To a Test Parameter<sup>1</sup>

This standard is issued under the fixed designation E1143; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

## 1. Scope

1.1 This test method determines the degree of linearity of a photovoltaic device parameter with respect to a test parameter, for example, short-circuit current with respect to irradiance.

1.2 The linearity determined by this test method applies only at the time of testing, and implies no past or future performance level.

1.3 This test method applies only to non-concentrator terrestrial photovoltaic devices.

1.4 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.5 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

## 3. Terminology

3.1 *Definitions*—For definitions of terms used in this test method, see Terminologies [E772](#) and [E1328](#).

3.2 *Definitions of Terms Specific to This Standard:*

3.2.1 *photovoltaic device parameter*—a characteristic of a photovoltaic device, such as short-circuit current or open-circuit voltage.

3.2.2 *test parameter*—a characteristic of the test conditions to which the photovoltaic device is exposed, such as irradiance or temperature.

3.3 *Symbols:*

Meaning	Symbol
Test parameter	$X$
Device parameter	$Y$
Number of data pairs taken	$n$
Slope of the linear function	$m$
Fit to the data	
Estimated variance of the slope	$s^2$

## 4. Summary of Test Method

4.1 This test method requires the measurement of the parameters in question at or near the anticipated device operating conditions. The number of measurements made must be sufficient to cover the range of operating conditions expected.

4.2 Device electrical parameters shall be measured in accordance with Test Methods [E948](#) or Methods [E1036](#), whichever is applicable.

4.3 A linear function that passes through the origin is fit to the data, and the deviation of these data from the function is used as the criterion for determining linearity.

## 5. Significance and Use

5.1 This test method is used to evaluate the applicability of other ASTM test methods to a photovoltaic device.

5.2 The procedure described in this test method is intended to be used to determine the degree of linearity between the short-circuit current of a photovoltaic device and the irradiance level incident on the device. This test method can be used for other device parameters, provided the function passes through the origin.
