CEN/TR 17559:2022 (E)**European foreword**

This document (CEN/TR 17559:2022) has been prepared by Technical Committee CEN/TC 454 “Algae and algae products”, the secretariat of which is held by NEN.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN shall not be held responsible for identifying any or all such patent rights.

This document supersedes CEN/TR 17559:2021.

Any feedback and questions on this document should be directed to the users’ national standards body. A complete listing of these bodies can be found on the CEN website.

SIST-TP CEN/TR 17559:2022

<https://standards.iteh.ai/catalog/standards/sist/548acd43-30a6-4f05-a46f-5eae8aacc65ff/sist-tp-cen-tr-17559-2022>

Introduction

This document has been prepared by the experts of CEN/TC 454 'Algae and algae products'.

The European Committee for Standardization (CEN) was requested by the European Commission (EC) to draft European standards or European standardization deliverables to support the implementation of Article 3 of Directive 2009/28/EC for algae and algae-based products or intermediates.

This request, presented as Mandate M/547¹, also contributes to the Communication on "Innovating for Sustainable Growth: A Bio economy for Europe".

The former working group CEN Technical Board Working Group 218 "Algae", was created in 2016 to develop a work programme as part of this Mandate. The technical committee CEN/TC 454 'Algae and algae products' was established to carry out the work programme that will prepare a series of standards.

The interest in algae and algae-based products or intermediates has increased significantly in Europe as a valuable source including but not limited to, carbohydrates, proteins, lipids, and several pigments. These materials are suitable for use in a wide range of applications from food and feed purposes to other sectors, such as textile, cosmetics, biopolymers, biofuel and fertilizer/biostimulants. Standardization was identified as having an important role in order to promote the use of algae and algae products.

The work of CEN/TC 454 should improve the reliability of the supply chain, thereby improving the confidence of industry and consumers in algae, which include macroalgae, microalgae, cyanobacteria, Labyrinthulomycetes, algae-based products or intermediates and will promote and support commercialisation of the European algae industry.

This document has been prepared in close collaboration with the CEN/TC 454 working groups. The European standards and technical reports developed in this mandate include:

CEN/TC 454/WG 1 Terminology

- CEN/TR 17559, Algae and algae products - Food and feed applications: General overview of limits, procedures and analytical methods

CEN/TC 454/WG 2 Identification

- EN 17477, Algae and algae products - Identification of the biomass of microalgae, macroalgae, cyanobacteria and Labyrinthulomycetes - Detection and identification with morphological and/or molecular methods

CEN/TC 454/WG 3 Productivity

- EN 17480, Algae and algae products - Methods for the determination of productivity of algae growth sites

CEN/TC 454/WG 5 Specifications for non-food/feed sector applications

- CEN/TR 17611, Algae and algae products - Specifications for cosmetic sector applications
- CEN/TR 17739, Algae and algae products - Specifications for chemical and biofuels sector applications
- CEN/TR 17612, Algae and algae products - Specifications for pharmaceutical sector applications

1 Scope

This document describes product specifications, product characteristics and other relevant information for algae and algae products for food, nutraceutical and animal feed applications. This document is a general overview of available limits, procedures and analytical methods applicable to algae and algae products used for food and feed applications.

This document does not apply to pharmaceutical, cosmetics, fertilizer/biostimulants, chemical and biofuel applications.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

EN 17399, *Algae and algae products - Terms and definitions*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in EN 17399 and the following apply:

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- IEC Electropedia: available at <https://www.electropedia.org/>
- ISO Online browsing platform: available at <https://www.iso.org/obp>

3.1

algae and algae products

functional group of organisms consisting of microalgae, macroalgae, cyanobacteria, Labyrinthulomycetes and products derived thereof

Note 1 to entry: examples of products are biomass, extracts or derivatives from algae, including a.o. algal oil and algal powder.

4 Product specifications

4.1 General

The interest in algae and algae products has increased significantly in Europe as a source of carbohydrates, proteins, lipids, minerals, several pigments etc. These materials are suitable for use in a wide range of applications for food and feed purposes and to other sectors, such as textile, cosmetics, biopolymers, biofuel and fertilizers and biostimulants.

Depending on the application different information on product characteristics (Clause 5) are required as product specification by the applicable regulation.

4.2 Food

All algae and algae products intended for food or food ingredients are accompanied by basic information on the product in line with applicable EU regulation for food labelling as well as specific directives from some EU countries. Some are mandatory and other optional and are dependent on the target market. These product specifications for food contain information that includes but is not limited to [27]:

- energy;
- content of fat, saturates, carbohydrate, sugars, protein, and salt (sodium);
- other nutrients (e.g. vitamins, minerals, fibre, polyols) [31];
- total sulphites;
- moisture;
- ingredients and presence of allergens;
- shelf-life, including requirements for storage and shipping;
- contaminants as defined as critical in the risk assessment of the food safety management system (e.g. heavy metals).

4.3 Feed

All algae and algae products intended for feed or feed ingredients are be accompanied by basic information on the product. These product specification for feed contain information, where applicable, that includes but is not limited to [45]:

- type of feed and intended use;
- energy;
- crude protein;
- crude oils and fats;
- crude fibre;
- crude ash;
- amino acids (lysine and methionine);
- minerals (calcium, sodium, phosphorus, magnesium);
- moisture;
- feed additives;
- minimum storage life;
- contaminants as defined as critical in the risk assessment of the feed safety management system (e.g. heavy metals).

4.4 Type of product specification documents

4.4.1 General

Different product specification documents with information on algae and algae products should be used by organisations. These documents are not mandatory and are used for information exchange.

4.4.2 Technical Data Sheet (TDS)

The technical data sheet is a technical document containing the technical parameters adopted to characterize the product and therefore being the equivalent of the Certificate of Analysis (4.4.3). The TDS includes the typical ranges of different parameters used to define the product characteristics or applicable regulatory limits. Examples of a TDS for some algae are attached as Annex A.

4.4.3 Certificate of Analysis (CoA)

The certificate of analysis is a document issued by the organization based on actual laboratory results to report test results of the sample. It includes references to the analytical method and quality standard(s) used. It may or may not have legal value.

4.4.4 Product data sheet (PDS)

The product data sheet is a document issued by the manufacturer for marketing purposes and usually used to provide product approval information to the customer.

4.4.5 Raw Material Specification (RMS)

The raw material specification is a technical document about the product, usually prepared by manufacturer, directed to provide all product approval information to the customer and usually attached to a commercial contract.

4.4.6 Material Safety Data Sheet (MSDS)

The material safety data sheet is a document issued according to EC Regulation [37] with the aim of providing product compliance information in respect of human health and safety at the workplace and protection of the environment.

This document is issued by the manufacturer for hazardous substances and mixtures and is not required for all materials or products. In general, an MSDS is not necessary for food and feed applications.

NOTE Some customers ask for an MSDS even if it is not mandatory. It is the algae and algae product manufacturer's responsibility to check the applicable regulation case by case. Algae and algae products can or can possibly not fall under the MSDS obligation.

5 Product characteristics

5.1 Purity

5.1.1 General

The product purity is defined as the percentage of a specific component in the total amount of a product. Any other substances are specified in the technical data sheet.

Purity is affected by the accidental presence or the fraudulent addition of any organism, part or product of an organism, other than named in the product specification and description of the concerned algae; or any extraneous substances with the same composition as dry algae, even in the absence of contamination. The minimum purity required for a food product will depend on the application of the algae or algae product and is agreed with the customer. The minimum requirement of purity for feed is regulated by

CEN/TR 17559:2022 (E)

legislation and customer contracts. Purity is not related to contamination since contamination will not affect the amount of required substance.

The following substances affecting the purity of a product can be addressed [47]:

- 1) Physical foreign matter (i.e. (micro) plastic fragments, wires from fishing nets and ropes, feathers from birds, shells, etc.);
- 2) Other algae (including toxin-producing cyanobacteria), bacteria or organic materials (e.g. grass, proteins or oils from other species);
- 3) Algae from other origin or location than stated (e.g. from Asia instead of Europe).

NOTE 1 The percentage is specified by mass fraction (kg/kg), volume fraction (m³/m³) or cell fraction (cell counts/all cell counts) or their corresponding concentrations if more appropriate.

NOTE 2 Foreign matter related to the use of genetically modified species or non-organic produced products are regulated by EU Regulation.

Methods of analysis to determine the purity of algae and algae products include qualitative and quantitative methods. If a qualitative method shows substances that affect the product purity, a quantitative method may be necessary. Various methods are suitable for fresh materials and dry materials or powders.

Available methods include visual inspection, microscopy, nucleic acids identification (DNA barcoding, PCR techniques, DNA microarrays, NGS, Q-PCR), molecular and chemical fingerprinting (fatty acid profile, pigment analysis) and isotopic analysis.

5.1.2 Physical foreign matter

Macroscopic examination is suitable for determining the presence of particles of foreign matter in whole or cut (macro)algae. Foreign matter are all materials which are not part of the (macro)algal biomass. Additional aids (like UV-light, sieving, centrifugation) might be helpful to find the foreign matter.

Microscopy is a suitable tool for microalgae, cyanobacteria, Labyrinthulomycetes and powdered materials and small particles of physical foreign matter for which macroscopic examination is not suitable. Reduction of particle size or powdering materials can hide the presence of foreign matter and make it more difficult to detect. Also diluted samples cannot be qualified and need a quantification step.

5.1.3 Other algae, bacteria or organic materials

Visual inspection is suitable for freshly harvested macroalgae as the intact cells can be recognized as a whole. When the holdfast is removed or when epiphytic organisms may be present on the surface and visual inspection may or may not be sufficient to identify the species after harvesting. Macroalgae need to be crushed and mixed and the mixture needs to be plated to identify which colonies are present in the sample. For ground algae, cells are disrupted and the algae species can no longer be recognized nor be quantified. Rehydration might help here. Specifically, for cyanobacteria, some guidance for the numeration of phytoplankton can provide the degree of purity on fresh samples [1].

Macroscopical and microscopical characterization includes features, which distinguish the algae material from potential non-specified substances. Identification tests need to be specifically validated for algae and are usually a combination of methods depending on the algae species. Identification tests include macroscopical characters, microscopical characters, chromatographic procedures and physicochemical analysis. Automated tools might help like cell counters or cell flow cytometers.

The development of methods based on nucleic acids characteristics (microsatellites, NGS, barcoding, RAPD, AFLP, etc.) to be sequenced and/or quantified (qPCR) from product samples would provide simple and fast tools for the identification of multiple targeted species and would help to indicate the presence

of other nucleic acids than those of the algal material. Other horizontal analytical methods useful for purity detection (molecular or chemical fingerprinting like fatty acid analysis, etc) will be developed in CEN/TC 460 'Food and feed authenticity'. Currently, there is a lack of databases for the identification of foreign matter.

5.1.4 Algae from other location

The most promising test to detect the presence of algae from other regions then stated, is the use of stable isotopes. However, first databases with the characterization of isotopes from different regions needs to be established [47]. Another method is the use of lipidomics tools, although these tools also require the establishment of databases [60].

Currently these methods are not yet standardized and available for routine testing. In addition, essential databases are not complete to identify all different species. Therefore, good farming practices (GFP), good manufacturing practices (GMP), traceability and Chain of Custody systems are essential to monitor the purity for algae and algae products.

An overview of the currently available types of foreign matter and respective detection methods including qualitative and quantitative determination are shown in Annex B, Table B.1 [47]. The reliability of these different methods depends on the complexity of the species and foreign matter and are not necessarily sufficient for each case.

5.1.5 Methods of analysis

The inventory of available methods and recommendation for prioritizing future method development on purity of algae and algae products are listed in Annex B, Table B.2.

Specific gaps to use these methods are lack of respectively [47]:

- sampling strategies for visual inspection and microscopy;
- quantification method for microscopy;
- databases, algae selective primers and protocols for nucleic acids identification; and
- databases for molecular and chemical fingerprinting and isotope analysis (see Annex B, Table B.3).

In addition to the gap per analysis methodology, methods are lacking for the quantification of the found foreign matter. Furthermore, protocols describing what to do with the product if the presence of a foreign matter is detected, are lacking.

It is recommended to further develop and standardize the following protocols [47]:

- sample strategies for quality control of fresh materials and of dry/powdered materials;
- quality control protocols describing which other checks have to be done when foreign matter is found;
- visual inspection protocols for fresh materials and for dry/powdered materials;
- microscopical inspection protocols for fresh materials and for dry/powdered materials;
- protocol for molecular biological quality control taking into account the most important criteria;
- study the applicability of isotope analysis for specification of the region of origin.
