

Designation: ~~C1479-07a~~ Designation: C1479 – 10

Standard Practice for Installation of Precast Concrete Sewer, Storm Drain, and Culvert Pipe Using Standard Installations¹

This standard is issued under the fixed designation C1479; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This practice covers the installation of precast concrete pipe intended to be used for the conveyance of sewage, industrial wastes, and storm water and for the construction of culverts.

~~1.2A complete metric companion to this practice has been developed—~~

1.2 This practice is the inch-pound companion to Practice C1479M; therefore, no metric/SI equivalents are presented in this practice.

1.3 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

FIG. 2 Standard Embankment Installations

8. Foundation

- 8.1 The foundation shall be moderately firm to hard in situ soil, stabilized soil, or compacted fill material.
- 8.2 When unsuitable or unstable material is encountered, the foundation shall be stabilized.
- 8.3 Methods to prevent migration of soil fines shall be provided when groundwater or existing soil conditions are conducive to particle migration. Gravelly soils, with little or no fines, could migrate under certain conditions, causing lack of support.
- 8.4 Pipe installed over an unyielding foundation shall be cushioned so as to prevent blasting shock when future blasting is anticipated in the area.

9. Bedding

- 9.1 The bedding shall be constructed uniformly over the full length of the pipe barrel, as required for the designated standard installation, to distribute the loadbearing reaction uniformly on the pipe barrel over its full length, and to maintain the required pipe grade. See Fig. 4. If placed in layers, the thickness of the layers shall be as required to achieve the specified compaction and as required by the project specifications.
- 9.2 The bedding layers for standard installation Types 1, 2, and 3 shall be placed to be as uniform as possible, but shall be loosely placed uncompacted material under the middle third of the pipe prior to placement of the pipe.
- 9.3 The maximum aggregate size shall be 1 in. when the bedding thickness is less than 6 in. and 1½-in. when the bedding thickness is 6 in. or greater, except as noted in 9.4.
- 9.4 When in situ soils conforming to project specifications are used in constructing the bedding for Type 3 and 4 installations, the maximum aggregate size shall not be greater than 3 in., or half the bedding thickness, whichever is less.
- 9.5 The use of aggregate sizes larger than 1 in. shall be limited to 20 % of the bedding material by weight.
- 9.6 Bell holes shall be excavated in the bedding or foundation, or both, when installing pipe with expanded bells so that the pipe is supported by the barrel and not by the bells. See Fig. 4.
- 9.7 Any outer bedding under the lower side areas shall be compacted to at least the same requirements as for the lower side areas.

10. Pipe Placement and Joining

- 10.1 Pipe shall be installed to the line and grade shown on the project plans and specifications. The joint shall be as specified in the project specifications and shall be installed in accordance with the pipe manufacturer's recommendations.

NOTE 1—(Advisory) Where practical, work should be started at the lowest end of the pipeline and the pipe laid with the bell end upgrate.

NOTE—Clearance between pipe and trench wall shall be adequate to enable specified compaction but not less than $D_o/6$.

FIG. 3 Standard Trench Installations

10.2 If required, the top of the pipe section being laid shall be positioned to the correct rotational orientation and then joined.

10.3 The bedding grade under the middle third of the pipe outside diameter shall be prepared before laying the pipe section. Making adjustments in grade by exerting force on the barrel of the pipe with excavating equipment, by lifting and dropping the pipe, or by lifting the pipe and packing bedding material under it shall be prohibited. If the installed pipe section is not on grade, the pipe section shall be completely unjoined, the grade corrected, and the pipe then rejoined.

11. Haunch

11.1 The haunch shall be constructed using the specified soil type and the minimum compaction level required for the designated standard installation. It shall be placed and compacted uniformly for the full length of the pipe barrel so as to distribute the load-bearing reaction uniformly to the bedding over the full length of the pipe barrel. If placed in layers, the thickness of the layers shall be as required to achieve the specified compaction and as required by the project specifications.

11.2 The maximum aggregate size for the haunch shall be the same as the maximum aggregate size in the bedding as defined in 9.3, except as noted in 11.3.

11.3 When in situ soils conforming to project specifications are used in constructing the pipe haunches for Type 3 and 4 installations, the maximum aggregate size shall not be greater than 3 in.

11.4 The use of aggregate sizes larger than 1 in. shall be limited to 20 % of the haunch material by weight.

11.5 Placed soil shall be deposited and compacted to the specified density uniformly on each side of the pipe to prevent lateral displacement of the pipe.

12. Lower Side

12.1 The lower side, if not in situ, shall be constructed using the specified soil type and the minimum compaction level required for the designated standard installation. If placed in layers, the thickness of the layers shall be as required to achieve the specified compaction and as required by the project specifications.

12.2 The soil, if not in situ, shall be material conforming to the project specifications, and contain no debris, organic matter, frozen material, or large stones with a diameter greater than one half the thickness of the compacted layers being placed.

12.3 Placed soil shall be deposited and compacted to the specified density uniformly on each side of the pipe to prevent lateral displacement of the pipe.
