INTERNATIONAL ELECTROTECHNICAL COMMISSION

OPTICAL FIBRE CABLES –

**Part 1-217: Generic specification –
Basic optical cable test procedures – Environmental test methods –
Cable shrinkage (fibre protrusion), Method F17**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as “IEC Publication(s)”). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 60794-1-217 has been prepared by subcommittee 86A: Fibres and cables, of IEC technical committee 86: Fibre optics. It is an International Standard.

This first edition of IEC 60794-1-217 cancels and replaces Method F17 of the second edition of the IEC 60794-1-22:2017, which will be withdrawn. It includes an editorial revision, based on the new structure and numbering system for optical fibre test methods. Additionally, there are a few technical changes.

This edition includes the following significant technical changes with respect to IEC 60794-1-22:2017:

- a) added clarification in the objective that the purpose of this test procedure is to measure the permanent fibre protrusion of cables without rigid strength members;
- b) replaced the reference to method F1 for the apparatus with a detailed description for the temperature chamber and temperature sensing device as done in IEC 60794-1-211;
- c) added a measuring device in the clause for apparatus;

- 101 d) added conditioning before cutting the cable sample as done in IEC 60794-1-211
 102 e) added a few sub-clauses for the section with the procedure;
 103 f) added all required steps in the subclause for temperature cycling as well as the table for the
 104 minimum soak time and the figure for the cycle procedure, and removed the reference to
 105 IEC 60794-1-22, method F1;
 106 g) improved the figures and added a figure for preparation of the cable sample;
 107 h) added the informative Annex A for the test procedure recommended for cables with rigid
 108 strength members.

109 The text of this International Standard is based on the following documents:

Draft	Report on voting
86A/XX/FDIS	86A/XX/RVD

110
 111 Full information on the voting for its approval can be found in the report on voting indicated in
 112 the above table.

113 The language used for the development of this International Standard is English.

114 This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in
 115 accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available
 116 at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are
 117 described in greater detail at www.iec.ch/publications.

118 The committee has decided that the contents of this document will remain unchanged until the
 119 stability date indicated on the IEC website under webstore.iec.ch in the data related to the
 120 specific document. At this date, the document will be

- 121 • reconfirmed,
- 122 • withdrawn,
- 123 • replaced by a revised edition, or
- 124 • amended.

125

126

127

INTRODUCTION

128 This document defines the test method F17 to measure the change of fibre protrusion at both
129 cable ends caused by cable shrinkage due to thermal exposure.

130 The numbering of this test method continues the F-series numbering sequence of IEC 60794-
131 1-22:2017. This document cancels and replaces method F17 of IEC 60794-1-22:2017, which
132 will be withdrawn. It includes an editorial revision, based on the new structure and numbering
133 system for optical fibre cable test methods. Additionally, technical changes were implemented.
134 The environmental tests contained in IEC 60794-1-22:2017 will be individually numbered in the
135 IEC 60794-1-2xx series. Each test method is now considered to be an individual document
136 rather than part of a multi-test method compendium. Full cross-reference details are given in
137 IEC 60794-1-2.

138 All cables have a memory effect in the form of coils and are elastic depending on the applied
139 force that makes repeatable and reproducible measurements from one end to the other end on
140 a longer cable sample (for example 10 m or longer) very difficult or impossible. Therefore,
141 measurement of the fibre or cable element protrusion at both ends is a suitable and simple
142 alternative.

143 The advantage of this method is that the change in protrusion length can be directly compared
144 with the capability to accommodate this change of protrusion length in the application situation
145 (for example in a fibre distribution box). The limitation of this method is that the absolute
146 changes of the cable elements and sheath lengths cannot be determined.

147 The test method in this document determines the permanent fibre protrusion of cables without
148 rigid strength members compared to the cable elements and cable sheath due to temperature
149 changes. The reference for the fibre protrusion is in this case the end of the cable sheath.

150 The determination of the permanent fibre protrusion according to this test method is not
151 applicable if the strongest rigid strength member, often the central strength member, is to serve
152 as a reference. This is the case when the fixing of the rigid strength member is used in a
153 protective housing and the fixing of the rigid strength member is stronger than the fixing of the
154 cable sheath. For such an installation situation, the recommended test procedure is given in
155 Annex A.

156 IEC TR 62959 describes the test method F17 that can be optionally used as an indicator for
157 cables terminated with hardened connectors, terminated into passive components, fixed into a
158 module, a divider or a protective housing with the fibres terminated with splices.

159 IEC TR 62959 provides information on cable shrinkage characterisation of optical fibre cables
160 that consist of standard glass optical fibres for telecommunication applications. The
161 characterisation is directed to the effects of cable shrinkage or cable element shrinkage on the
162 termination of cables. Recommended test methods for the evaluation of cable shrinkage as an
163 indicator and classification by several grades are given.

164 A test procedure other than method F17 to measure shrinkage effects exists. Method F11
165 according to IEC 60794-1-211 defines shrinkage testing on a cable sample with a nominal
166 length of 1 m or less by calculation of the change in sheath length measured before and after
167 thermal exposure.

178 **1 Scope**

179 This part of IEC 60794 defines the test procedure to measure the permanent fibre protrusion
180 compared to the cable elements and cable sheath due to thermal exposure of a cable.

181 **2 Normative references**

182 The following documents are referred to in the text in such a way that some or all of their content
183 constitutes requirements of this document. For dated references, only the edition cited applies.
184 For undated references, the latest edition of the referenced document (including any
185 amendments) applies.

186 IEC 60794-1-1, *Optical fibre cables – Part 1-1: Generic specification – General*

187 IEC 60794-1-2, *Optical fibre cables – Part 1-2: Generic specification – Basic optical cable test*
188 *procedures – General guidance*

189 **3 Terms and definitions**

190 For the purposes of this document, the terms and definitions given in IEC 60794-1-1 and the
191 following apply.

192 ISO and IEC maintain terminology databases for use in standardization at the following
193 addresses:

- 194 • IEC Electropedia: available at <https://www.electropedia.org/>
- 195 • ISO Online browsing platform: available at <https://www.iso.org/obp>

196 **3.1** 197 **shrinkage**

198 irreversible contraction after extrusion of plastic materials caused by heating or over time at
199 ambient temperature

200 **4 Method F17 – Cable shrinkage (fibre protrusion)**

201 **4.1 Objective**

202 The purpose of this test procedure is to measure the permanent fibre protrusion of cables
203 without rigid strength members compared to the cable elements and cable sheath due to
204 temperature changes. The reference for the fibre protrusion is in this case the end of the cable
205 sheath.

206 The determination of the permanent fibre protrusion according to this test method is not
207 applicable if the strongest rigid strength member, often the central strength member, is to serve
208 as a reference. This is the case when the fixing of the rigid strength member is used in a
209 protective housing and the fixing of the rigid strength member is stronger than the fixing of the

210 cable sheath. For such an installation situation, the recommended test procedure is given in
211 Annex A.

212 Low shrinkage of cable elements and cable sheath is important for termination of connectors
213 and passive optical components as well as in installations of protective housings with reinforced
214 cables. The permanent (or irreversible) fibre protrusion at the cable ends can occur when the
215 cable is used in areas with elevated temperature or direct exposure to the sun. Cable designs
216 with low friction between the stabilisation elements (for example rigid strength member) and
217 high material shrinkage (created by the extrusion process) can cause excessive and permanent
218 fibre protrusion at the cable end and can lead to an attenuation increase, cable attachment
219 degradation, sealing weakening and in severe cases fibre breakage.

220 4.2 Sample

221 The cable sample shall have a minimum length of 10 m.

222 NOTE IEC TR 62959 recommends a length of 20 m for evaluation of the fibre protrusion because the observed
223 change of fibre protrusion of cable samples with a length of 20 m were often larger than with a sample length of
224 10 m.

225 4.3 Apparatus

226 A temperature chamber of appropriate size and a temperature sensing device. The temperature
227 chamber shall be able to accommodate the cable sample and maintain the specified
228 temperature within ± 3 °C.

229 A length measuring device of sufficient length for measuring the protrusion length of the fibres
230 and secondary fibre protection or fibre tube with a minimum resolution of 1 mm (see Figure 2
231 and Figure 3).

232 NOTE For the test procedure recommended for cables with rigid strength member(s), see Figure A.1 and
233 Figure A.2.

234 4.4 Procedure

235 4.4.1 Preparation of the cable sample

236 The cable on the supply reel, or alternatively the cable coil, shall be conditioned for 24 h at
237 ambient temperature before cutting the cable sample, unless otherwise specified.

238 The cable sample shall be coiled in loose windings with a minimum diameter of 0,6 m, unless
239 otherwise specified. The cable coils shall be loosely fixed at least at two places distributed
240 around the circumference in a way that the cable elements are not held inside the cable and
241 are free to move (expand and contract), as shown in Figure 1.

242

243 **Key**

- 244 1 coiled cable sample
- 245 2 loose fixing of cable sample coils

246 **Figure 1 – Preparation of cable sample with prepared ends**

247 **4.4.2 Preparation of the cable ends**

248 The outer cable sheath shall be removed over a length of l_2 from the cable sample end, as
 249 shown in Figure 2. Also the strength members, inner sheath and other cable elements should
 250 be stripped closely to the end of the outer cable sheath. The secondary fibre protection or fibre
 251 tubes shall be removed over a length of l_1 from the end of the fibres as shown in Figure 2. This
 252 preparation shall be done at both cable sample ends.

253 For cable types where the fibres are loosely embedded in the cable, the pulling out and pushing
 254 in the fibres should be avoided during preparation and measurement.

255 *Dimensions in millimetres*

257 **Key**

- 258 1 fibre or bundle of fibres
- 259 2 secondary fibre protection or fibre tube
- 260 3 cable sheath

261 **Figure 2 – Preparation of cable sample ends**

263 At ambient temperature, the complete cable sample, including both cable ends, shall be put in
 264 the temperature chamber.

265 **4.4.3 Initial measurements**

266 The initial fibre protrusion shall be measured from the edge of the secondary fibre protection or
 267 fibre tube (L_1) and from the edge of the cable sheath (L_2) of all cable elements at both ends,
 268 as shown in Figure 3.
