INTERNATIONAL ELECTROTECHNICAL COMMISSION

OPTICAL FIBRE CABLES –

**Part 1-217: Generic specification –
Basic optical cable test procedures –
Environmental test methods – Cable shrinkage (fibre protrusion),
Method F17**

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as “IEC Publication(s)”). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC 60794-1-217 has been prepared by subcommittee 86A: Fibres and cables, of IEC technical committee 86: Fibre optics. It is an International Standard.

This first edition of IEC 60794-1-217 cancels and replaces Method F17 of the second edition of the IEC 60794-1-22:2017, which will be withdrawn. It includes an editorial revision, based on the new structure and numbering system for optical fibre test methods. Additionally, there are a few technical changes.

This edition includes the following significant technical changes with respect to IEC 60794-1-22:2017:

- a) replaced the reference to method F1 for the apparatus with a detailed description for the temperature chamber and temperature sensing device as done in IEC 60794-1-211;
- b) added a measuring device in the clause for apparatus;
- c) added conditioning before cutting the cable sample as done in IEC 60794-1-211

- 84 d) added a few sub-clauses for the section with the procedure;
- 85 e) improved the figures and added a figure for preparation of the cable sample.
- 86 The text of this International Standard is based on the following documents:

Draft	Report on voting
XX/XX/FDIS	XX/XX/RVD

87

88 Full information on the voting for its approval can be found in the report on voting indicated in

89 the above table.

90 The language used for the development of this International Standard is English.

91 This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in

92 accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available

93 at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are

94 described in greater detail at www.iec.ch/standardsdev/publications.

95 The committee has decided that the contents of this document will remain unchanged until the

96 stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to

97 the specific document. At this date, the document will be

- 98
- 99
- 100
- 101
- reconfirmed,
 - withdrawn,
 - replaced by a revised edition, or
 - amended.

103

INTRODUCTION

104 This document defines the test method F17 to measure the change of fibre protrusion at both
105 cable ends caused by cable shrinkage due to thermal exposure.

106 The numbering of this test method continues the F-series numbering sequence of IEC 60794-
107 1-22:2017. This document cancels and replaces method F17 of IEC 60794-1-22:2017, which
108 will be withdrawn. It includes an editorial revision, based on the new structure and numbering
109 system for optical fibre cable test methods. Additionally, technical changes were implemented.
110 The environmental tests contained in IEC 60794-1-22:2017 will be individually numbered in the
111 IEC 60794-1-2xx series. Each test method is now considered to be an individual document
112 rather than part of a multi-test method compendium. Full cross-reference details are given in
113 IEC 60794-1-2.

114 All cables have a memory effect in the form of coils and are elastic depending on the applied
115 force that makes repeatable and reproducible measurements from one end to the other end on
116 a longer cable sample (e.g. 10 m or longer) very difficult or impossible. Therefore, measurement
117 of the fibre or cable element protrusion at both ends is a suitable and simple alternative.

118 The advantage of this method is that the change in protrusion length can be directly compared
119 with the capability to accommodate this change of protrusion length in the application situation
120 (e.g. in a fibre distribution box). The limitation of this method is that the absolute changes of
121 the cable elements and sheath lengths cannot be determined.

122 IEC TR 62959 describes the test method F17 that can be optionally used as an indicator for
123 cables terminated with hardened connectors, terminated into passive components, fixed into a
124 module, a divider or a protective housing with the fibres terminated with splices.

125 IEC TR 62959 provides information on cable shrinkage characterisation of optical fibre cables
126 that consist of standard glass optical fibres for telecommunication applications. The
127 characterisation is directed to the effects of cable shrinkage or cable element shrinkage on the
128 termination of cables. Recommended test methods for the evaluation of cable shrinkage as an
129 indicator and classification by several grades are given.

130 A test procedure other than method F17 to measure shrinkage effects exists. Method F11
131 according to IEC 60794-1-211 defines shrinkage testing on a cable sample with a nominal
132 length of 1 m or less by calculation of the change in sheath length measured before and after
133 thermal exposure.

144 **1 Scope**

145 This part of IEC 60794 defines the test procedure to measure the permanent fibre protrusion
146 compared against the cable elements and cable sheath due to thermal exposure of a cable.

147 **2 Normative references**

148 The following documents are referred to in the text in such a way that some or all of their content
149 constitutes requirements of this document. For dated references, only the edition cited applies.
150 For undated references, the latest edition of the referenced document (including any
151 amendments) applies.

152 IEC 60794-1-1, *Optical fibre Cables – Part 1-1: Generic specification – General*

153 IEC 60794-1-22, *Optical fibre Cables – Part 1-22: Generic specification – Basic optical cable*
154 *test procedures – Environmental test methods*

155 **3 Terms and definitions**

156 For the purposes of this document, the terms and definitions given in IEC 60794-1-1 and the
157 following apply.

158 ISO and IEC maintain terminological databases for use in standardization at the following
159 addresses:

- 160 • IEC Electropedia: available at <http://www.electropedia.org/>
- 161 • ISO Online browsing platform: available at <http://www.iso.org/obp>

162 **3.1 shrinkage**

163 irreversible contraction after extrusion of plastic materials caused by heating or over time at
164 ambient temperature

165 **4 Method F17 – Cable shrinkage (fibre protrusion)**

166 **4.1 Objective**

167 The purpose of this test is to measure the permanent fibre protrusion compared against the
168 cable elements and cable sheath due to temperature changes.

169 Low shrinkage of cable elements and cable sheath is important for termination of connectors
170 and passive optical components as well as in installations of protective housings with reinforced
171 cables. The permanent (or irreversible) fibre protrusion at the cable ends can occur when the
172 cable is used in areas with elevated temperature or direct exposure to the sun. Cable designs
173 with low friction between the stabilisation elements (e.g. rigid strength member) and high
174 material shrinkage (created by the extrusion process) can cause excessive and permanent fibre
175 protrusion at the cable end and can lead to an attenuation increase, cable attachment
176 degradation, sealing weakening and in severe cases fibre breakage.

177 **4.2 Sample**

178 The cable sample shall have a minimum length of 10 m.

179 NOTE IEC TR 62959 recommends a length of 20 m for evaluation of the fibre protrusion because the observed
180 change of fibre protrusion of cable samples with a length of 20 m were often larger than with a sample length of 10
181 m.

182 **4.3 Apparatus**

183 A temperature chamber of appropriate size and a temperature sensing device. The temperature
184 chamber shall be able to accommodate the cable sample and maintain the specified
185 temperature within ± 3 °C.

186 A length measuring device of sufficient length with a minimum resolution of 1 mm.

187 **4.4 Procedure**

188 **4.4.1 Preparation of the cable sample**

189 The cable on the supply reel, or alternatively the cable coil, shall be conditioned for 24 h at
190 ambient temperature before cutting the cable sample, unless otherwise specified.

191 The cable sample shall be coiled in loose windings with a minimum diameter of 0,6 m, unless
192 otherwise specified. The cable coils shall be loosely fixed at least at two places distributed
193 around the circumference in a way that the cable elements are not held inside the cable and
194 are free to move (expand and contract), as shown in Figure 1.

195 **Key**

196 1 coiled cable sample

197 2 loose fixing of cable sample coils

198 **Figure 1 - Preparation of cable sample with prepared ends**

199 **4.4.2 Preparation of the cable ends**

200 The cable outer sheath shall be removed over a length of l_2 from the cable sample end, as
201 shown in Figure 2. Also the strength members, inner sheath and other cable elements should
202 be stripped closely to the end of the cable outer sheath. The secondary fibre protection or fibre
203 tubes shall be removed over a length of l_1 from the end of the fibres as shown in Figure 2. This
204 preparation shall be done at both cable sample ends.

205 For cable types where the fibres are loosely embedded in the cable, the pulling out and pushing
206 in the fibres should be avoided during preparation and measurement.

207

Dimensions in millimetres

208

l_1	l_2
100	200

209 **Key**

- 210 1 fibre or bundle of fibres
 211 2 secondary fibre protection or fibre tube
 212 3 cable sheath

213

Figure 2 - Preparation of cable sample ends

214 The cable sample shall be put into the temperature chamber.

4.4.3 Initial measurements

215 The initial fibre protrusion shall be measured from the edge of the secondary fibre protection or
 216 fibre tube ($L1$) and from the edge of the cable sheath ($L2$) of all cable elements at both ends,
 217 as shown in Figure 3.
 218

219 **Key**

- 220 1 fibre or bundle of fibres
 221 2 secondary fibre protection or fibre tube
 222 3 cable sheath

223 NOTE The protrusion of the secondary fibre protection or fibre tube is represented as length $L3$, that can be
 224 calculated as $L2$ minus $L1$.

225

Figure 3 - Fibre protrusion measurement

226 If multiple fibres are within a fibre tube, then one fibre shall be selected for the measurements
 227 (e.g. red coloured fibre).
