Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 204, *Intelligent transport systems*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

Background and motivation

In recent years, the road tolling policy in the world has spread to other than conventional toll road tolling such as funding for road infrastructure management and maintenance, environmental measures, and traffic management. Specifically, in order to accommodate the widespread use of low-fuel-consumption and electric vehicles, introduction of road use tolling instead of fuel tax, congestion tolling on urban roads and inter-urban roads is planned and implemented.

In the countries where dedicated short-range communication (DSRC)-based electronic fee collection (EFC) systems are widely deployed, upgrading and extension of the schemes, to include presently non-toll roads become a significant issue to be considered and solved.

This document describes how DSRC-based EFC systems, especially on-board equipment (OBE), can be enhanced to meet these needs.

There are three cases of introducing EFC systems to cope with those situations:

- Case-1: Existing DSRC-based EFC system is extended and introduced on new roads.
- Case-2: Autonomous tolling system is introduced on both new roads and the existing toll roads.
- Case-3: DSRC-based EFC system continues to operate on existing toll roads, and the autonomous tolling system is introduced on new toll roads.

For Case-1 and Case-2, the necessary interface definitions and the test procedures are already defined by existing EFC standards. For Case-3 as shown in Figure 1, the OBE used for DSRC-based EFC can also be used for the autonomous tolling system covering new roads and existing toll roads.

DSRC-OBE is possible to be reused for new EFC environments consisting of DSRC-based EFC and the autonomous tolling system by expanding functionally by interfacing with the external in-vehicle device that includes global navigation satellite systems (GNSS) module, cellular module and other related modules.

Consequently, an application interface definition between DSRC-OBE and the external in-vehicle devices is essential and needs to be standardized.

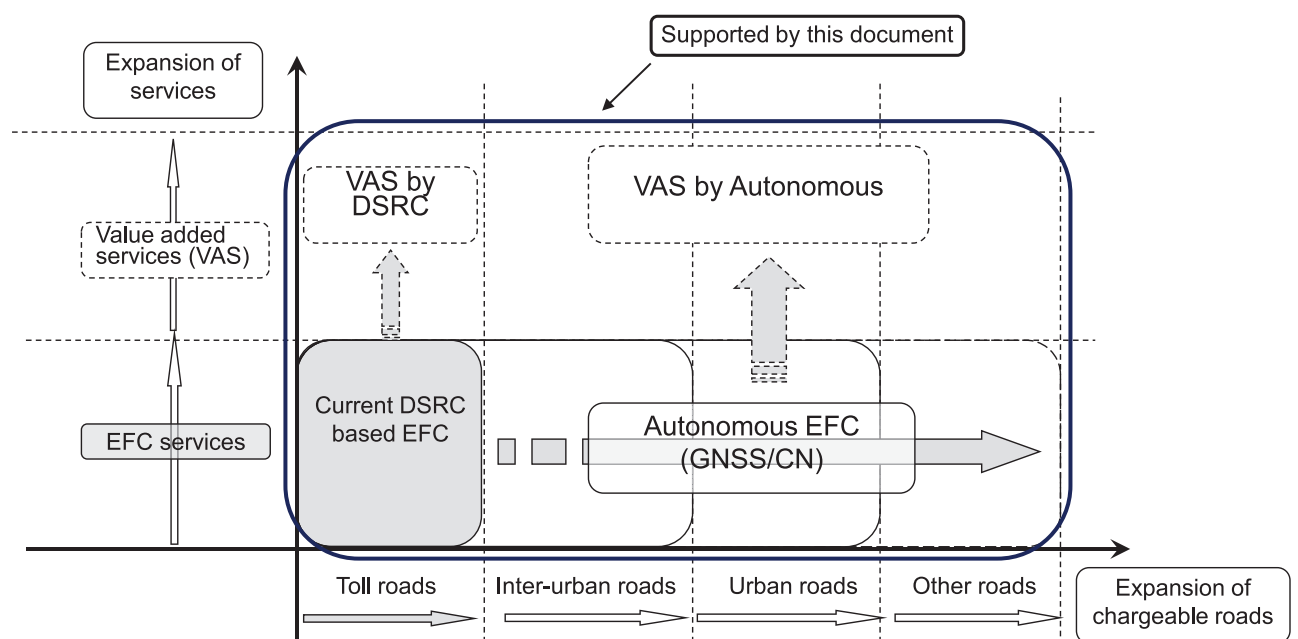

Figure 1 — Image of expanding toll roads and services (Case-3)

Purpose of this document

The purpose of this document is to provide support for enhanced functionalities of DSRC-OBE by means of external in-vehicle devices.

This document aims at defining:

- A tolling model with the external in-vehicle devices (in the main part of the document);
- Definitions of data groups and data elements (in the main part of the document);
- Data type definition and implementation conformance statement (ICS) proforma (in [Annexes A](#) and [B](#)).

Applicable DSRC-OBE

There are five major DSRC standards currently deployed for EFC around the world. In standardizing an application interface between DSRC-OBE and an external on-vehicle device, the interface should be applied for every type of DSRC as shown in [Figure 2](#).

Figure 2 — Applicable DSRC-OBE

Thanks to its operational reliability and robustness, DSRC-OBE is suitable for long-term use for EFC. On the other hand, each component of external in-vehicle devices typically has a shorter product life than DSRC-OBE in order to meet changing user demands for multi-functional and high performance equipment.

Once an application interface has been standardized, DSRC-OBE can be used continuously in a variety of EFC environments with an enhanced new external in-vehicle device as shown in [Figure 3](#).

Figure 3 — Applicability for future upgrading

Electronic Fee Collection (EFC) — Application interface definition between DSRC-OBE and external in-vehicle devices

1 Scope

This document defines an application interface between DSRC-based OBE (hereinafter referred to as "DSRC-OBE") and an external in-vehicle device (hereinafter referred to as "the external device") to make DSRC-OBE applicable for diversified external devices.

NOTE For use in autonomous tolling and DSRC-based (CEN, UNI, ARIB, TTA and GB/T) electronic fee collection (EFC) systems. For use in urban and inter-urban toll schemes.

The scope of this document covers the following items (as shown in [Figure 4](#)):

- definitions of the application interface between DSRC-OBE and external devices, including global navigation satellite system (GNSS), cellular network (CN) and controller area network (CAN) device;
- definitions of data groups and data elements.

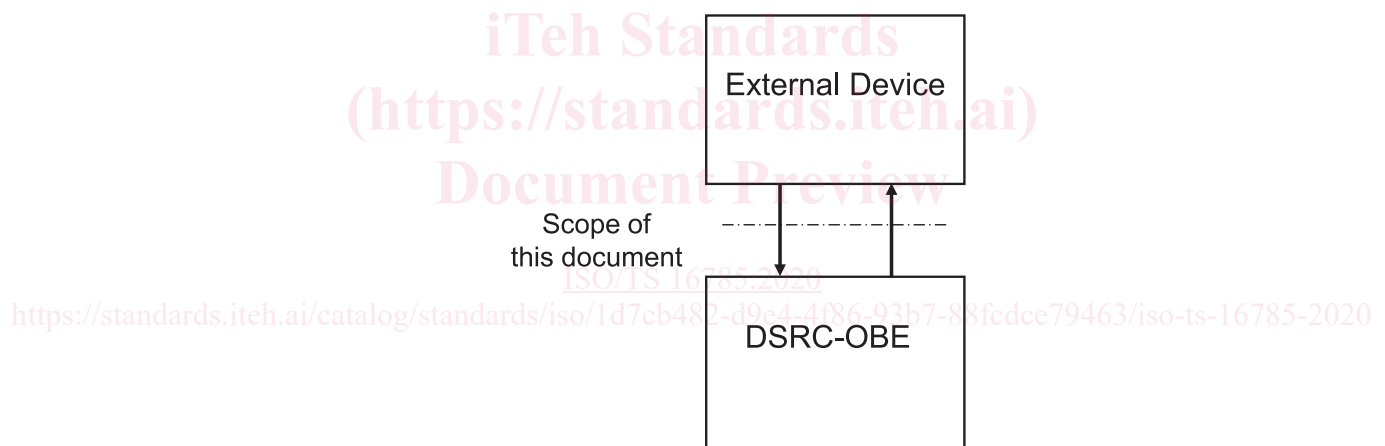

Figure 4 — Scope of this document

The following items are out of the scope of this document:

- definitions of hardware components in the external device such as GNSS module, CN module and mobile devices;
- definitions of the physical interface between DSRC-OBE and the external device such as USB and Bluetooth;
- definition of ITS services other than EFC;
- definition of algorithms for authentication, encryption and key management.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at <https://www.iso.org/obp>

— IEC Electropedia: available at <http://www.electropedia.org/>

3.1

attribute

addressable package of data consisting of a single data element or structured sequences of data elements

3.2

autonomous tolling system

tolling system which is able to obtain usage data using on-board equipment independent from roadside equipment

3.3

data element

coded information, which might itself consist of lower level information structures

3.4

data group

class of closely related *attributes* (3.1)

3.5

external in-vehicle device

component that can be connected to a piece of on-board equipment (OBE) in a vehicle

EXAMPLE Mobile phone or digital tachograph.

3.6

issuer

entity responsible for issuing the payment means to the user

3.7

on-board equipment

OBE

all required equipment on-board a vehicle for performing required electronic fee collection (EFC) functions and communication services

3.8**on-board unit****OBU**

single electronic unit on-board a vehicle for performing specific electronic fee collection (EFC) functions and for communication with the external systems

3.9**roadside equipment****RSE**

equipment located along the road, either fixed or mobile

3.10**toll service provider****TSP**

entity providing toll services in one or more toll domains

3.11**transaction**

whole of the exchange of information between two physically separated communication facilities

4 Symbols and abbreviated terms

For the purpose of this document, the following abbreviated terms apply throughout the document unless otherwise specified.

ARIB	Association of Radio Industries and Businesses (Communication standardizing body in Japan)
ASN.1	Abstract Syntax Notation One (ISO/IEC 8824-1)
CAN	Controller Area Network
CCC	Compliance check Communication (ISO 12813)
CE	Central Equipment
CN	Cellular Network
DSRC	Dedicated Short-Range Communication
EFC	Electronic Fee Collection
GB/T	Guojia Biaozhun/Tuijian (Chinese "Recommended National Standard")
GNSS	Global Navigation Satellite System
HMI	Human Machine Interface
ICC	Integrated Circuit Card
ICS	Implementation Conformance Statement
ITS	Intelligent Transport Systems
LAC	Localisation Augmentation Communication
OBE	On-board Equipment
OBD	On-board diagnostics

OBU	On-board Unit
RSE	Roadside Equipment
TSP	Toll Service Provider
TTA	Telecommunications Technology Association (Communication standardizing body in Korea)
UNI	Ente Nazionale Italiano di Unificazione
USB	Universal Serial Bus

5 Tolling models with the in-vehicle device

5.1 General

The DSRC-OBE with an external device can support various EFC environments and further ITS services.

There are two kinds of settlement method in EFC, one is the on-board account system, and the other method is the central account system. In the on-board account system, payment means may be connected to DSRC-OBE as shown in [Figure 5](#), and the toll amount determined by the tolling transaction processes is directly deducted from payment means.

This document only address EFC schemes where the on-board account system is operated using an ICC.

Figure 5 — Arrangement of payment means

5.2 Tolling model

5.2.1 Operating environment

The system in which DSRC-OBE is connected to an external device should support the diversified tolling system that supports both the autonomous tolling system and DSRC-based tolling system as shown in [Figure 6](#). In the diversified tolling system, the external device consists of the various components listed in [Table 1](#).
