## COMMITTEE DRAFT FOR VOTE (CDV)

PROJECT NUMBER:

**IEC 62902 ED2**

DATE OF CIRCULATION:

**2024-05-03**

CLOSING DATE FOR VOTING:

**2024-07-26**

SUPERSEDES DOCUMENTS:

**21/1180/CD, 21/1192A/CC**

IEC TC 21 : SECONDARY CELLS AND BATTERIES

SECRETARIAT:

France

SECRETARY:

Mr Yves BOUDOU

OF INTEREST TO THE FOLLOWING COMMITTEES:

SC 21A, TC 35

PROPOSED HORIZONTAL STANDARD:

Other TC/SCs are requested to indicate their interest, if any, in this CDV to the secretary.

FUNCTIONS CONCERNED:

EMC

ENVIRONMENT

QUALITY ASSURANCE

SAFETY

SUBMITTED FOR CENELEC PARALLEL VOTING

NOT SUBMITTED FOR CENELEC PARALLEL VOTING

**Attention IEC-CENELEC parallel voting**

The attention of IEC National Committees, members of CENELEC, is drawn to the fact that this Committee Draft for Vote (CDV) is submitted for parallel voting.

The CENELEC members are invited to vote through the CENELEC online voting system.

This document is still under study and subject to change. It should not be used for reference purposes.

Recipients of this document are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Recipients of this document are invited to submit, with their comments, notification of any relevant "In Some Countries" clauses to be included should this proposal proceed. Recipients are reminded that the CDV stage is the final stage for submitting ISC clauses. (SEE AC/22/2007 OR NEW GUIDANCE DOC).

TITLE:

**Secondary cells and batteries - Marking symbols for identification of their chemistry**

PROPOSED STABILITY DATE: 2029

## INTERNATIONAL ELECTROTECHNICAL COMMISSION

75

76

77

**SECONDARY CELLS AND BATTERIES –  
MARKING SYMBOLS FOR IDENTIFICATION OF THEIR CHEMISTRY**

78

79

80

## FOREWORD

81 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising  
82 all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international  
83 co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and  
84 in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports,  
85 Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their  
86 preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with  
87 may participate in this preparatory work. International, governmental and non-governmental organizations liaising  
88 with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for  
89 Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.

90 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international  
91 consensus of opinion on the relevant subjects since each technical committee has representation from all  
92 interested IEC National Committees.

93 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National  
94 Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC  
95 Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any  
96 misinterpretation by any end user.

97 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications  
98 transparently to the maximum extent possible in their national and regional publications. Any divergence between  
99 any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.

100 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity  
101 assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any  
102 services carried out by independent certification bodies.

103 6) All users should ensure that they have the latest edition of this publication.

104 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and  
105 members of its technical committees and IEC National Committees for any personal injury, property damage or  
106 other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and  
107 expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.

108 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is  
109 indispensable for the correct application of this publication.

110 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent  
111 rights. IEC shall not be held responsible for identifying any or all such patent rights.

112 International Standard IEC 62902 has been prepared by IEC technical committee 21:  
113 Secondary cells and batteries.

114 This second edition cancels and replaces the first edition published in 2019. This edition  
115 constitutes a technical revision.

116 This edition includes the following significant technical changes with respect to the previous  
117 edition:

118 a) Added an Introduction

119 b) Added exemptions and clarifications for the background colour requirement for the  
120 marking

121 c) Added a calculation method for the battery volume

122 d) Added a second footnote to the Scope

123 e) Added a term and definition for the principal display panel

124 f) Added additional chemistry information for Li-ion batteries

125 g) Added a new Subclause on adaptive size

126 h) Clarified the test methods for durability / permanence of the marking

127 The text of this International Standard is based on the following documents:

FDIS	Report on voting

128  
129 Full information on the voting for the approval of this International Standard can be found in the  
130 report on voting indicated in the above table.

131 This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

132 The committee has decided that the contents of this document will remain unchanged until the  
133 stability date indicated on the IEC website under "http://webstore.iec.ch" in the data related to  
134 the specific document. At this date, the document will be

- 135 • reconfirmed,
- 136 • withdrawn,
- 137 • replaced by a revised edition, or
- 138 • amended.

139

**IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.**

141

## INTRODUCTION

142 The aim of this document is to introduce uniform marking symbols for the identification of the  
143 secondary battery chemistries prevailing on the market. A primary reason is that lead smelters  
144 around the world are reporting increasing numbers of lithium ion batteries finding their way into  
145 the lead-acid battery waste stream. Because the shape and design of these batteries sometimes  
146 is very similar, it can be difficult for sorting facilities and battery smelters to distinguish one  
147 technology from the other if there is no clear identification of the battery chemistry by marking  
148 symbols.

149 Processing lithium ion batteries within a Lead smelter, e-waste facility, or municipal waste  
150 sorting facility, can result in fire or explosions, with numerous accidents or near-accidents  
151 already reported in European and US recycling facilities.

152 Besides lead-acid and lithium ion batteries, the labelling scheme should also apply to other  
153 battery chemistries with a significant market share, such as Nickel Metal Hydride and Nickel  
154 Cadmium. Other batteries, such as Sodium ion batteries, should be included in the marking  
155 scheme when their market share becomes significant.

156 A clear identification of the battery chemistry would be helpful during the whole lifetime of the  
157 battery, i.e. during selection and purchase of a new battery (e.g. by economic operators as well  
158 as end users), transportation, installation and operation of the battery as well as collection,  
159 sorting, storage and treatment of waste batteries.

160 The following standards/recommendations were considered during the development of this  
161 document:

162 The Battery Association of Japan (BAJ) has issued 'Guidelines for Recycle Mark on  
163 rechargeable cells and batteries for portable applications' which include an optional colour code  
164 system for identifying major (rechargeable) battery chemistries: Pb, Ni-Cd, Ni-MH, and Li-ion.  
165 These Guidelines also distinguish different cathode materials as well as important impurities  
166 (mostly from the anode material).

167 Call2Recycle has introduced in Canada and the United States of America a licensed labelling  
168 program for batteries. It is a non-profit organization that collects and recycles batteries on behalf  
169 of companies that pay a fee to license the label.

170 The recycling symbol required on batteries within the Scope of this document is the General  
171 Symbol for Recovery/Recyclable as standardised in ISO 7000-1135, see item 1 in [Table 1](#). It is  
172 worth noting the information that ISO offers for this symbol: Function/description: To indicate  
173 that the marked item or its material is part of a recovery or recycling process. Additional  
174 information: The symbol is applicable only to those products or materials for which at the end  
175 of life there is a well-established collection route and recycling process, and which does not  
176 significantly impair the effectiveness of other recycling schemes.

177 Battery marking is also subject of regional legislation. One example is the crossed-out wheeled  
178 bin, used in the European Union (EU) and in some other countries to make consumers aware  
179 of their obligation to offer batteries for separate collection. The symbol is combined with  
180 symbols for substances of very high concern (SVHC), namely cadmium (Cd) and lead (Pb)  
181 exceeding certain concentration levels per Regulation (EU) 2023/1542 (Batteries Regulation)<sup>1</sup>.

182 In the frame of discussions aiming at improving collection programs, it was suggested that  
183 battery labels should have a consistent and simple marking (e.g., a colour code) across all

---

<sup>1</sup>) There is no requirement to add the Hg symbol to the separate collection symbol. However, there is a requirement for max. 0,0005 % Hg for all batteries in Annex I *Restriction on substances* of the Batteries Regulation.

184 battery chemistries to encourage and aid appropriate handling which should, at a minimum,  
185 address three primary goals – in descending order of priority:

- 186 2) Inform and educate consumers to keep batteries out of the trash and curbside recycling,  
187 and direct batteries to dedicated battery recycling networks where available.
- 188 3) Provide consumers and recycling network employees human-readable information to enable  
189 sorting of used batteries among major chemistry families (e.g., Pb, Li-ion, Ni-Cd, Ni-MH,  
190 and Li-metal).
- 191 4) If appropriate within a chemistry family, inform recyclers of the unique features, components,  
192 and/or constituents for recovery (e.g., cathode material)."

193 Table 1 contains a list of recycling and ecolabels that can be expected on batteries.

194 **Table 1 – Recycling and ecolabels regarding batteries**

195

No.	Symbol	Official name	Alternative information	Purpose	Source reference
1		General symbol for recovery/recyclable	Möbius loop, three curved arrows	To indicate that the marked item or its material is part of a recovery or recycling process.	ISO 7000-1135 www.iso.org/obp
2		4 in 1 symbol	The white interior shows 4 arrows pointing outwards		Environmental Protection Administration of Taiwan
3		Crossed-out wheeled bin		indicating 'separate collection' for all batteries and accumulators	Regulation (EU) 2023/1542
4		Call 2 Recycle battery seal		Private recycling program in the USA and Canada	Battery recycling Seal usage standards
5		Recycling symbol and chemistry for batteries	Guidelines for recycle mark on batteries	Compliance with the Japanese Law for the Promotion of Effective Utilization of Resources	Tecchio, P. et al., Analysis of material efficiency aspects of personal computers product group, JRC Report EUR 28394 EN (2018), page 60
6		U.S. Mercury-Containing and Rechargeable Battery Recycling Act symbol (Battery Council International model)	See footnote <sup>a</sup>	See footnote <sup>b</sup>	42 U.S.C. § 14322(b)

<sup>a</sup> Three chasing arrows or a comparable recycling symbol. For Nickel-Cadmium batteries, the symbol must also state "Ni-Cd" and the phrase "BATTERY MUST BE RECYCLED OR DISPOSED OF PROPERLY." For Lead acid batteries, the symbol must also state "Pb" or the words "LEAD", "RETURN", and "RECYCLE" and if the regulated battery is sealed, the phrase "BATTERY MUST BE RECYCLED."

<sup>b</sup> Model symbol developed by Battery Council International for Small Sealed Lead Acid (SSLA) batteries in compliance with the U.S. Mercury-Containing and Rechargeable Battery Recycling Act. Variations allowed.

196

197 During the preparation of the 2<sup>nd</sup> edition, the Scope of this document was subject to intensive  
198 discussions. One of the subjects that were discussed, was the inclusion of a battery's energy  
199 content. Some experts thought that a limit like the 100 Wh limit used in dangerous goods  
200 transportation regulations to distinguish between "fully regulated" and "exempted" when offering  
201 batteries for transport under UN numbers 3480 and 3481 could be suitable to distinguish

202 between different levels of labelling requirements. However, these thoughts were not pursued  
203 as they applied only to lithium ion batteries and could hardly be translated into a technology  
204 agnostic language. No generally acceptable calculation method was found that would enable  
205 the transfer of the energy limit from lithium ion batteries to other chemistries.

206 A limit of 100 Wh for lithium ion spare batteries in the FAA and IATA regulations for carry-on  
207 baggage on board of passenger aircraft was not considered to be suitable for consideration due  
208 to similar reasons. The same applied even more to a mass limit of 500 g applicable during the  
209 collection of lithium batteries according to Special Provision 636 of the ADR (Agreement for the  
210 carriage of Dangerous goods by Road).

211 Other suggestions were made to limit the Scope to batteries with one or more dimension(s)  
212 exceeding 5 cm or, in a different proposal, 100 mm. However, it could not be shown how these  
213 limits would correlate with each other and with the volume limit of 900 cm<sup>3</sup> and/or why they  
214 would be more suitable than the volume limit.

215 It has also been discussed to add the following recommendation: In addition, the markings may  
216 be used also on secondary battery packaging and in accompanying documents when secondary  
217 batteries are placed on the market.
