Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 153, *Valves*.

This second edition cancels and replaces the first edition (ISO 6002:1992), which has been technically revised.

The main changes compared to the previous edition are as follows:

- in the whole text, deletion of PN 20 and PN 50, addition of PN 63 and inclusion of nominal pipe sizes NPS and Class designations;
- update of the normative references in [Clause 2](#);
- addition of definitions for DN, NPS, PN and Class;
- revision of [Figure 1](#) identifying valves terms and [Figure 6](#) for butt-welding for auxiliary connections;
- addition of requirements for gate in [5.3](#) and stem in [5.4](#);
- addition of requirements for closure test in [5.6](#);
- deletion of former [Table 1](#) on body wall thickness, deletion of former [Table 3](#) on end-to-end dimensions for butt-weld end valves and deletion of former [5.4](#) on envelope dimensions;
- revision of [Table 1](#) on body end port inside diameter, and [Table 8](#) on component materials;
- update of [Clause 7](#) on testing and inspection and [Clause 8](#) on marking.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Industrial valves — Bolted bonnet steel gate valves

1 Scope

This document specifies the requirements for bolted bonnet steel gate valves having the following features:

- bolted bonnet;
- outside screw and yoke;
- inside screw (alternative for PN 10, PN 16, Class 150, PN 25 and PN 40 only);
- single or double obturator;
- wedge or parallel seating;
- with or without non-metallic obturator or seat seals;
- flanged or butt-welding ends.

It covers valves of the nominal sizes DN:

- 10; 15; 20; 25; 32; 40; 50; 65; 80; 100; 125; 150; 200; 250; 300; 350; 400; 450; 500; 600; 700; 800; 900; 1 000;

corresponding to nominal pipe sizes NPS:

- $\frac{3}{8}$; $\frac{1}{2}$; $\frac{3}{4}$; 1; 1 $\frac{1}{4}$; 1 $\frac{1}{2}$; 2; 2 $\frac{1}{2}$; 3; 4; 5; 6; 8; 10; 12; 14; 16; 18; 20; 24; 28; 32; 36; 40;

and applies to valves of the following pressure designations:

- PN 10; 16; 25; 40; 63; 100;
- Class 150; 300; 600.

This document applies to bolted bonnet steel gate valves used for all industrial applications.

Additional requirements given in the relevant application standards can apply to bolted bonnet steel gate valves used for more specific applications (e.g. for the water industry, the chemical and petrochemical process industry, the oil and gas industry).

ITEH STANDARD PREVIEW
(standards.iteh.ai)

3 Terms and definitions

ISO/FDIS 6002

<https://standards.iteh.ai/catalog/standards/sist/9df502e7-6402-40df-99ea-04ca8077423c/iso-145-6002>

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <http://www.electropedia.org/>

3.1

nominal size

DN

NPS

alphanumeric designation of size for components of a pipework system, which is used for reference purposes, comprising the letters DN or NPS followed by a dimensionless number indirectly related to the physical size, in millimetres, of the bore or outside diameter of the end connections

Note 1 to entry: The number following the letters DN or NPS does not represent a measurable value and is not used for calculation purposes except where specified in the relevant standard.

Note 2 to entry: See ISO 6708 and ASME B16.34.

3.2 PN Class

alphanumeric designation for pressure-temperature rating that is common for components used in a piping system, used for reference purposes, comprising the letters "PN" or "Class" followed by a dimensionless number indirectly related to the pressure retaining capability as a function of temperature of the component

Note 1 to entry: The number following the letters PN or Class does not represent a measurable value and is not used for calculation purposes except where specified in the relevant standard. There is no definitive correlation that links PN designations to Class designations.

Note 2 to entry: See ISO 7268 and ASME B16.34.

4 Pressure/temperature ratings

4.1 The pressure/temperature ratings shall be in accordance with EN 12516-1 for PN-designated valves and in accordance with ASME B16.34 for Class-designated valves.

4.2 The temperature shown for a corresponding pressure rating is the temperature of the pressure-containing shell of the valve. In general, this temperature is the same as that of the contained fluid. The use of a pressure rating corresponding to a temperature other than that of the contained fluid is the responsibility of the user.

4.3 For temperatures below the lowest temperature listed in the pressure/temperature rating tables, the working pressure shall not be greater than the pressure stated for the lowest listed temperature. The use of valves at lower temperatures is the responsibility of the user. Consideration should be given to the loss of ductility and impact strength of many materials at low temperature.

5 Design

5.1 Body wall thickness

5.1.1 The terms used in [5.1](#) are illustrated in [Figure 1](#). d is the minimum inside diameter given in [Table 1](#).

5.1.2 The minimum body wall thickness, T_m , at the time of manufacture, shall be in accordance with:

- EN 12516-1 or EN 12516-2 for PN-designated valves,
- ASME B16.34 or EN 12516-1 for Class-designated valves.

Exceptions are given in [5.1.3](#) to [5.1.5](#).

Additional metal thickness needed for assembly stresses, closing stresses, stress concentrations and shapes other than circular shall be determined by the manufacturers, since these factors vary widely.

5.1.3 The weld preparation in butt-welding end valves (see [5.2.2.2](#)) shall not reduce the body wall thickness to less than the values specified in [5.1.2](#) within a region closer to the outside surface of the body neck than T_m measured along the run direction.

The transition to the weld preparation shall be gradual and the section shall be essentially circular through the entire length of the transition. Sharp discontinuities or abrupt changes in section in areas that infringe into the transition shall be avoided, except that test collars or bands, either welded or integral, are allowed.

In no case shall the thickness be less than $0,77 T_m$ at a distance of $2 T_m$ from the weld end.

5.1.4 The valve body neck shall maintain the minimum body wall thickness T_m as specified in 5.1.2 within the distance $1,1 \sqrt{dT_m}$ measured from the outside of the body run along the neck direction, where d is the inside diameter as defined in 5.2.1.3.

Beyond the distance $1,1 \sqrt{dT_m}$ from the outside of the body run, straight circular sections of body necks with inside diameter d' shall be provided with a minimum local wall thickness of T' where T' is determined, by interpolation if necessary, as the value of T_m which would correspond to a value of d equal to $2d'/3$, using the applicable nominal pressure rating.

For any case where $d' > 1,5 d$, the newly determined minimum wall thickness for the body neck will be greater than the basic value T_m . In such cases, this greater wall thickness shall be provided for all parts of the body neck having a diameter greater than $1,5 d$.

5.1.5 Local areas having less than the minimum wall thickness are acceptable provided that all of the following limitations are satisfied.

- a) The area of less than minimum thickness can be enclosed by a circle whose diameter is no greater than $0,35 \sqrt{dT_m}$.
- b) Measured thickness is no less than $0,75 T_m$
- c) Enclosure circles are separated from each other by an edge-to-edge distance of no less than $1,75 \sqrt{dT_m}$.

Figure 1 — Identification of terms

5.2 Body dimensions

5.2.1 Flanges

5.2.1.1 Body end flanges shall comply with the requirements of ASME B16.34 for Class-designated valves and EN 1092-1 for PN-designated valves. Raised face end flanges shall be provided unless otherwise specified by the purchaser.

5.2.1.2 Face-to-face dimensions for flanged end valves shall be in accordance with ISO 5752 for the appropriate pressure designation.

5.2.1.3 End flanges shall be cast or forged integral with the body except that flanges may be attached by welding by a qualified welding operator using a qualified welding procedure, provided that all such flanges on valves DN 50 and larger are butt-welded. Any heat treatment necessary to ensure that the material is suitable for the full range of service temperatures shall be performed.

5.2.1.4 For unlined flanged valves, the minimum inside diameter, d , of the body end port shall be as specified in [Table 1](#) as applicable.

5.2.2 Weld ends

5.2.2.1 End-to-end dimensions for butt-weld end valves shall comply with the requirements of ASME B16.10 for Class designated valves, and EN 12982 for PN designated valves, unless otherwise specified in the purchase order.

5.2.2.2 Butt-welding ends shall be in accordance with the details shown in Figure 2, unless otherwise specified in the purchase order.

a) Welding end for connection to pipe of wall thickness $T \leq 22$ mm b) Welding end for connection to pipe of wall thickness $T > 22$ mm

Key

- A outside diameter of welding end (see Table 2)
- B inside diameter of pipe (for tolerance on B, see Table 2)
- T wall thickness of pipe

Intersections should be slightly rounded.

Valves having a minimum wall thickness $T_m \leq 3$ mm may have ends cut square or slightly chamfered.

NOTE 1 The inside and outside surfaces of valve welding ends are machine finished overall. The contour within the envelope is at the option of the manufacturer unless specifically ordered otherwise.

NOTE 2 For the outside diameters and wall thicknesses of standard steel pipes, see ISO 4200.

5.3 Gate

5.3.1 Gate configurations are categorized as illustrated in [Figure 3](#).

A one-piece wedge gate—as either a solid or flexible wedge design—shall be furnished, unless otherwise specified.

A two-piece split wedge gate or parallel seat double disc gate may be furnished when specified. A split wedge gate consists of two independent seating parts that conform to the body seats when closed. A double disc gate has a spreading mechanism that forces the two parallel discs to the body seats when closed.

5.3.2 Except for a double disc gate, in the open position, the gate shall completely clear the valve seat openings.

5.3.3 Gate and gate guides shall be designed so that all parts can function properly independent of installed valve orientation.

5.3.4 Guides shall be provided in the gate and shell and these guides shall be designed to minimize seat wear and maintain gate-to-stem alignment in all valve orientations. Gate-to-shell design shall take into account the wear that may be caused by corrosion, erosion and abrasion.

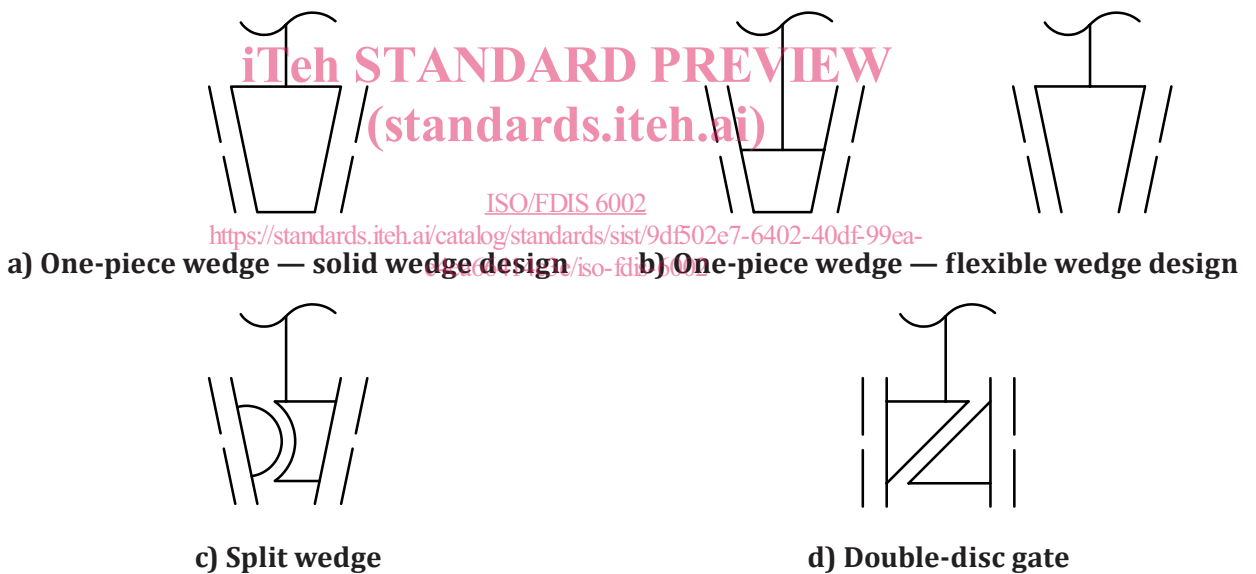

Figure 3 — Types of valve gates

5.3.5 Gate seating surfaces shall be integral or faced with weld metal. Unless specified, hardfaced seating surfaces are not required. Finished thickness of any facing material shall be not less than 1,6 mm.

5.3.6 Wedge gates shall be designed to account for seat wear. The dimensions that fix the position of the gate seats relative to the body seats shall be such that the gate, starting from the time of manufacture, can, as a result of seat wear, move into the seats by a distance, h , defined as wear travel. Wear travel is in
