## INTERNATIONAL ELECTROTECHNICAL COMMISSION

## OPTICAL FIBRE CABLES –

**Part 1-201: Generic specification –  
Basic optical cable test procedures –  
Temperature cycling, method F1**

## FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as “IEC Publication(s)”). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

International Standard IEC 60794-1-201 has been prepared by subcommittee 86A: Fibres and cables, of IEC technical committee 86: Fibre optics.

This first edition of IEC 60794-1-201 cancels and replaces Method F1 of the second edition of IEC 60794-1-22: 2017. It constitutes a technical revision.

This edition includes the following significant technical changes with respect to the previous edition:

- a) remove all references to the temperature sensing device and replace with note “for further study”;
- b) separate the conditioning procedure into Procedure 1 and Procedure 2 to avoid confusion;
- c) define the ambient temperature test condition as per IEC 60794-1-2;
- d) decrease the minimum soak time for sample mass larger than 16 kg in table 1.

The text of this International Standard is based on the following documents:

FDIS	Report on voting
XX/XX/FDIS	XX/XX/RVD

79

80 Full information on the voting for the approval of this International Standard can be found in the  
81 report on voting indicated in the above table.

82 The French version of this standard has not been voted upon.

83 This document has been drafted in accordance with the ISO/IEC Directives, Part 2.

84 A list of all parts in the IEC 60794 series, published under the general title *Optical fibre cables*,  
85 can be found on the IEC website.

86 The committee has decided that the contents of this document will remain unchanged until the  
87 stability date indicated on the IEC website under "<http://webstore.iec.ch>" in the data related to  
88 the specific document. At this date, the document will be

- 89 • reconfirmed,
- 90 • withdrawn,
- 91 • replaced by a revised edition, or
- 92 • amended.

93

98  
99  
100  
101  
102

#### 103 **1 Scope**

104 This part of IEC 60794-1 defines test procedures to be used in establishing uniform  
105 requirements for the environmental performance of

- 106 • optical fibre cables for use with telecommunication equipment and devices employing similar  
107 techniques, and
- 108 • cables having a combination of both optical fibres and electrical conductors.

109 Throughout this document, the wording "optical cable" can also include optical fibre units,  
110 microduct fibre units, etc.

111 This document defines a test standard to determine the ability of a cable to withstand the effects  
112 of temperature cycling by observing changes in attenuation.

113 See IEC 60794-1-2 for a reference guide to test methods of all types and for general  
114 requirements and definitions.

#### 115 **2 Normative references**

116 The following documents are referred to in the text in such a way that some or all of their content  
117 constitutes requirements of this document. For dated references, only the edition cited applies.  
118 For undated references, the latest edition of the referenced document (including any  
119 amendments) applies.

126 *procedures – General guidance*

#### 127 **3 Terms and definitions**

128 No terms and definitions are listed in this document.

129 ISO and IEC maintain terminological databases for use in standardization at the following  
130 addresses:

- 131 • IEC Electropedia: available at <http://www.electropedia.org/>
- 132 • ISO Online browsing platform: available at <http://www.iso.org/obp>

#### 133 **4 Method F1 – Temperature cycling**

##### 134 **4.1 Object**

135 This measuring method applies to optical fibre cables, which are tested by temperature cycling  
136 in order to determine the stability behaviour of the attenuation of cables submitted to

137 temperature changes. This method can also be used for evaluation of buffer tubes or other  
138 elements independent of a cable construction, as defined by a detail specification.

139 Changes in the attenuation of optical fibre cables, which can occur with changing temperature,  
140 are generally the result of buckling or tensioning of the fibres resulting from differences between  
141 their thermal expansion coefficient and the coefficients of the cable strength and sheath  
142 members. Test conditions for temperature-dependent measurements shall simulate the worst  
143 conditions.

144 This test can be used either for monitoring cable behaviour in the temperature range, which can  
145 occur during storage, transportation and usage, or to check, in a selected temperature range  
146 (usually wider than that required for the above-mentioned cases), the stability behaviour of the  
147 attenuation connected to a substantially microbend-free situation of the fibre within the cable  
148 structure.

149 NOTE 1 Method F12 in IEC 60794-1-212 is similar to this method, but with cable elements fixed at both sample  
150 ends. Method F12 assesses the attenuation behaviour of a cable without end movement intended for termination  
151 with, for example, interconnecting devices or passive components.

152 NOTE 2 The ageing test, method F9 in IEC 60794-1-209, uses method F1 as its pre- and post-test temperature  
153 cycle. Often these tests are performed together.

154 NOTE 3 The cable shrinkage test, method F17 in IEC 60794-1-217, uses method F1 as temperature cycling. These  
155 tests can be done together.

## 156 4.2 Sample

157 The sample shall be a factory length or a sample of sufficient length as indicated in the detail  
158 specification but, nevertheless, of length appropriate to achieve the desired accuracy of  
159 attenuation measurements. The sample is additionally defined as the cable sample as deployed  
160 for testing.

161 In order to gain reproducible values, the cable sample shall be brought into the climatic chamber  
162 in a manner such that the deployment does not affect the measurement. Such methods could  
163 be a loose coil or on a reel with large diameter coils, cushioned reels with a soft layer or a zero  
164 tension facility device.

165 The ability of the fibre(s) to accommodate differential expansion and contraction (e.g. by  
166 slipping within the cable) could be influenced by the bending radius of the cable. Sample  
167 conditioning should, therefore, be realized as close as possible to normal usage conditions.  
168 The bend diameter of the cable sample shall not violate the minimum bend diameter of the  
169 cable, tube or other unit as specified by the detail specification.

170 Potential problems are due to an actual difference between the expansion coefficients of the  
171 test sample and of the holder (e.g. reel, basket, plate) which can induce, during thermal cycles,  
172 a significant effect on the test result if "no effect" conditions are not completely fulfilled. The  
173 intent is to simulate the installed condition, in which the cable is generally straight for the  
174 majority of its length.

175 Parameters of influence are mainly the details of conditioning, the type and materials of the  
176 holder, and the diameter of the sample coil or reel.

177 General recommendations include the following.

178 a) The winding diameter shall be large enough to keep the ability of the fibre to accommodate  
179 differential expansion and contraction. A winding diameter substantially greater than the  
180 value selected for cable delivery can be necessary.

181 b) Any risk of cable expansion (or contraction) limitation created by conditioning shall be  
182 suppressed. In particular, special care should be taken to avoid residual tension on the  
183 cable during the test. For example, a tight winding on a drum is not recommended as it can  
184 limit cable contraction at low temperature. On the other hand, a tight multilayer winding can  
185 limit expansion at high temperature.

186 c) The use of loose winding is recommended with large diameter coils and cushioned reels  
187 with a soft layer or zero tension facility device.

188 d) The number of fibres tested shall conform to IEC 60794-1-1.

189 e) The fixed cable ends as well as connection to the equipment shall be outside of the  
190 temperature chamber to avoid negative influences.

191 When necessary, in order to limit the length of the cable under test, it is permissible to  
192 concatenate several fibres of the cable and to measure the concatenated fibres. The number  
193 of connections shall be limited and they should be located outside the climatic chamber.

### 194 4.3 Apparatus

195 The apparatus shall consist of the following.

196 a) An appropriate attenuation measuring apparatus for the determination of attenuation  
197 change (see the test methods of IEC 60793-1-46).

198 b) a climatic chamber of a suitable size to accommodate the sample whose temperature shall  
199 be controllable to remain within  $\pm 3$  °C of the specified testing temperature. One example of  
200 a suitable chamber is given in Clause 8 of IEC 60068-2-14:2009.

### 201 4.4 Procedure

#### 202 4.4.1 Preconditioning

203 The sample shall be preconditioned at standard ambient temperature conditions as defined in  
204 IEC 60794-1-2.

#### 205 4.4.2 Initial measurement

206 The sample shall be visually inspected and a basic value for attenuation at the initial  
207 temperature shall be determined.

#### 208 4.4.3 Conditioning

##### 209 Procedure 1

210 If only one high and low temperature is specified in the detail specification, then procedure 1 is  
211 applicable. Figure 1 shall be used for the initial cycle(s) and the final cycle during the test.  
212 Throughout this procedure, the ambient temperature condition is the standard test condition as  
213 defined in IEC 60794-1-2.

214 1) The sample at ambient temperature shall be introduced into the climatic chamber which is  
215 also at that temperature.

216 2) The temperature in the chamber shall then be lowered to the appropriate low temperature  
217  $T_{A2}$  at a rate of cooling not to exceed 60 °C per hour, unless otherwise specified.

218 3) After temperature stability in the chamber has been reached, the sample shall be exposed  
219 to the low temperature conditions for the appropriate period  $t_1$  (see (4), below).

220 4) A minimum soak time is given in Table 1; however, the soak time,  $t_1$ , shall be sufficient to  
221 bring the complete cable to equilibrium with the specified temperature.

222 NOTE Cable temperature sensing device to measure the temperature of the cable sample is for further study.

223 5) The temperature in the chamber shall then be raised to the appropriate high temperature  
224  $T_{B2}$  at a rate of heating not to exceed 60 °C per hour, unless otherwise specified.

225 6) After temperature stability in the chamber has been reached, the sample shall be exposed  
226 to the high temperature conditions for the appropriate period  $t_1$ .

227 7) The temperature in the chamber shall then be lowered to the value of the ambient  
228 temperature at the appropriate rate of cooling. This procedure constitutes one cycle. If this  
229 is the intermediate step in a series of cycles, no soak is required, and no measurements  
230 shall be taken.

231 8) Continue to the next cycles, using steps 2) through 7). The sample shall be subjected to at  
232 least two cycles unless otherwise required by the relevant detail specification. At the end of  
233 the cycling sequence, hold the sample at ambient temperature for the appropriate period  $t_1$ .

234 9) The change in attenuation shall be measured at ambient temperature at the start of the first  
235 cycle, at the end of the soak time  $t_1$  at each of the specified temperature steps ( $T_{A2}$ ,  $T_{B2}$ ) in  
236 the final cycle, and at ambient temperature at the end of the final cycle. If measurement at

237 intermediate cycles is required by the detail specification, the measurements shall be  
238 performed in the same manner.

239 10) Before removal from the chamber, the sample under test shall have reached temperature  
240 stability at ambient temperature.

## 241 Procedure 2

242 If multiple (two or more) low or high temperatures are specified in the detail specification, then  
243 procedure 2 is applicable. Figure 1 shall be used for the initial cycle(s) except for the final cycle  
244 and Figure 2 shall be used for the final cycle during the test. Throughout this procedure, the  
245 ambient temperature condition is the standard test condition as defined in IEC 60794-1-2.

246 1) The sample at ambient temperature shall be introduced into the climatic chamber which is  
247 also at that temperature.

248 2) Using steps 2) through 7) of Procedure 1 for the initial cycle(s) (except for the final cycle).

249 NOTE  $T_{A2}$  here is the extreme low temperature among multiple low temperatures and  $T_{B2}$  here is the extreme  
250 high temperature among multiple high temperatures.

251 3) During the last cycle, the sample shall be held at each intermediate temperature ( $T_{A1}$  or  $T_{B1}$ )  
252 and each extreme temperature ( $T_{A2}$  or  $T_{B2}$ ) for the appropriate time  $t_1$  as per Figure 2. At  
253 the end of the cycling sequence, hold the sample at ambient temperature for the appropriate  
254 period  $t_1$ .

255 4) The sample shall be subjected to at least totally two cycles unless otherwise required by  
256 the relevant detail specification. The change in attenuation shall be measured at ambient  
257 temperature at the start of the first cycle, at the end of the soak time  $t_1$  at each of the  
258 specified temperature steps ( $T_{A1}$ ,  $T_{A2}$ ,  $T_{B1}$ ,  $T_{B2}$ ) in the final cycle, and at ambient  
259 temperature at the end of the final cycle. If measurement at intermediate cycles is required  
260 by the detail specification, the measurements shall be performed in the same manner.

261 5) Before removal from the chamber, the sample under test shall have reached temperature  
262 stability at ambient temperature.

263

Table 1 – Minimum soak time  $t_1$

Minimum soak times for a given sample mass (weight of cable under test)	
Sample mass kg	Minimum soak time, $t_1$ h
Under 0,35	0,5
0,36 to 0,7	1
0,8 to 1,5	2
1,6 to 100	4
101 to 250	6
251 to 500	8
Over 501	12

NOTE 1 It is the responsibility of the tester to assure that the soak time is long enough to bring the cable to equilibrium with the specified temperature.

NOTE 2 If more than one sample is put into the chamber, the largest sample mass of all single samples should be compared with the values in the table for the determination of the minimum soak time.

264
