

Designation: F887-10a Designation: F887 - 11

Standard Specifications for Personal Climbing Equipment¹

This standard is issued under the fixed designation F887; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This standard covers the specifications and qualification testing of the following:

- Climbers,
- Climber straps,
- Climber Pads,
- Climber Footplates,
- Body Belts,
- Positioning Devices with Locking Snaphooks/Carabiners,
- Wood Pole Fall Restriction Devices (WPF RD),
- Harnesses,
- Shock Absorbing Lanyards.

These devices are used by workers in the climbing of poles, trees, towers, and other structures. Minimum performance criteria for arc resistance of harnesses and shock absorbing lanyards are included for workers who may be exposed to thermal hazards of momentary electric arcs or flame.

1.2 Three types of climbers, Types A, B, and C, and two types of climber straps, Types A and B, are covered.

1.3 Two types of body belts, Types A and B, are covered.

1.4 Four types of positioning devices: three positioning straps, Types A, B, and C, and adjustable positioning lanyards are covered.

1.5 Two types of WPF RD, Types A and AB, are covered.

1.6 Two types of harnesses, Types A and B, are covered.

1.7 Two types of shock absorbing lanyards, Types A and B, are covered.

1.8 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

1.9 The following safety hazards caveat pertains only to the test method portions, 9.2, 10.3, 11.2, 14.4, 15.3, 15.4, 19.2, 22.2, 23, 24, and 25 of these specifications: *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 *adjustable positioning lanyard (APL)*, *n*—a component of a work positioning or fall restriction system (may be used for applications such as transitioning past an obstruction during ascent or descent).

3.1.2 *billet*, *n*—the free (buckle hole) end of a belt or strap as opposed to the buckle end, which is designed to pass through the buckle for closing.

3.1.3 *body belt attachment*, *n*—a system of straps and buckles which allow the harness wearer to use a body belt in conjunction with the harness.

3.1.4 *climber*, *n*—device used to assist in ascending and descending wood poles or trees. Climbers generally consist of leg iron, gaff, sleeves, straps and pads.

3.1.5 *dee-ring*, *D-ring*, *n*—a steel straight-sided (no protrusions along edge of dee-ring; see Fig. 1) forging in a circle configuration with an integral stirrup to accept the belt, assembled into a body belt for the purpose of accepting the snaphooks of a positioning device.

3.1.6 *design test*, *n*—for arc and flame resistant materials, one made on a sample treated as representative of an industrial product; these tests will not generally be repeated in quantity production.

3.1.7 *dripping*, *n*—in electric arc testing, a material response evidenced by flowing of the fiber polymer, the fabric, or the fabric coating, and the evidence of droplets from the material, that characterizes overall performance relative to reducing the transfer of heat that is sufficient to cause a second-degree burn.

3.1.8 *electric arc ignition*, *n*—as related to electric arc exposure, a response that causes the ignition of the material which is accompanied by heat and light, and then subsequent burning for at least 5 s, or consumption of at least 25 % of the exposed test specimen area.

3.1.9 *fall arrest*, *n*—the action or event of stopping a free fall or the instant where the downward free fall has been stopped. (See ANSI Z359.0-2009.)

3.1.10 *fall restriction*, *n*—the act of preventing or limiting free fall from a work position, or while ascending or descending a wood pole.

3.1.11 *full body harness*, *n*—a component with a design of straps which is fastened about the person in a manner so as to contain the torso and distribute the fall arrest forces over at least the upper thighs, pelvis, chest, and shoulders with means for attaching it to other components or sub-systems.

3.1.12 *gaff*, *n*—a component of a pole or tree climber attached to the climber shank, similar to a spur, which is shaped to permit the secure penetration of the pole or tree trunk.

3.1.13 *keeper*, *n*—a component of the snaphook, used as a latching device and held in a closed position by a spring (see Fig. 2).

3.1.14 *leg iron*, *n*—a component of a pole or tree climber. The base or frame of the climber consisting of a shank and stirrup section. (see Fig. 3 for illustration of a leg iron with attached gaff and sleeve).

3.1.15 *length adjusting device (LAD)*, *n*—a device designed to add or take up slack in an adjustable positioning lanyard so that the system will accommodate various circumferences.

3.1.16 *locking mechanism*, *n*—a component of the snaphook used in conjunction with the keeper to retain the keeper in a closed position until intentionally released and opened. A snaphook thus equipped, becomes a “locking snaphook.”

3.1.17 *locking snaphook*, *n*—a snaphook with a locking mechanism (see 3.1.16).

3.1.18 *nose*, *n*—the curved end of the snaphook which the keeper rests on. It is rounded and overlaps the keeper latch in such a manner as to prevent the dee-ring from inadvertently releasing the snaphook (see Fig. 2).

3.1.19 *part (body belt), load-bearing*, *n*—a part of the body belt or positioning strap that, when in use with both snaphooks of the positioning strap engaged in one dee-ring of the body belt, will be required to support all or part of the mass of the user. This includes all the material in the positioning strap, and, in the case of the body belt, the material to which the dee-rings are directly fastened, and the material of the buckle strap that passes across the wearer’s abdomen.

FIG. 1 Typical Dee-Ring

FIG. 2 Components of Positioning Strap

FIG. 3 Critical Stress Area of the Climber

3.1.19.1 *Discussion*—This definition and the strength requirements described in 15.3.2 are designed to ensure that the buckle strap is strong enough to withstand certain emergency conditions, but are not to be construed as approval of attaching both snaphooks to the same dee-ring when working aloft. OSHA Subpart M (1926.502) prohibits working with two load-bearing snaphooks in the same dee-ring unless snaphooks are of the locking type and designed for such application.

3.1.20 *part (harness), load bearing, n*—a component of a harness to which arrest forces are directly transmitted in the event of a fall.

3.1.21 *permanent deformation, n*—a deformation occurring beyond the yield point so that the structure will not return to its original dimensions after removal of the applied force.

3.1.22 *protector, gaff, n*—a cap or guard designed to cover the points of pole or tree gaffs to protect the gaffs from damage or from injuring people or from damaging equipment.

3.1.23 *shock absorbing lanyard, n*—a lanyard containing a component whose primary function is to dissipate energy and limit deceleration forces which the system imposes on the body during fall arrest.

3.1.24 *stirrup, climber, n*—the footrest of the pole or tree climber.

3.1.25 *stirrup, snaphook/dee-ring, n*—the closed rectangular portion of the positioning strap snaphook, or body belt dee-ring (see Fig. 1 and Fig. 2), that accepts the strap or belt material in a permanent manner.

3.1.26 *wood pole fall restriction device (WPRFD), n*—a device that when properly adjusted and combined with other subcomponents and elements, allows the climber to remain at his or her work position with both hands free, and that performs a fall restriction function if the climber loses contact between his or her gaffs and the pole.

3.1.27 *work positioning, n*—the act of supporting the body with a positioning system for the purpose of working with hands free. (See ANSI Z359.0-2009.)

4. Significance and Use

4.1 The following personal tools or equipment covered by these specifications are:

4.1.1 Climbers and climber straps used to ascend and descend poles and trees.

4.1.2 Body belts and positioning devices utilized for work positioning on poles, ladders, or structures.

4.1.3 WPRFD and adjustable positioning lanyards are used as components of a work positioning and fall restriction system and utilized in conjunction with a body belt.

4.1.4 Full body harnesses and shock absorbing lanyards utilized in preventing and arresting falls.

4.2 Test methods included in these specifications are intended to provide uniform test procedures.

4.3 Snaphooks (non-locking)—(not permitted by this standard).

4.3.1 Locking snaphooks (required by this standard) manufactured to meet the requirements of these specifications, effectively prevent rollout from occurring and are able to be operated with one hand when working aloft.

4.4 Illustrations are furnished only to amplify the text. They are not to be considered restrictive as to specific design details, except where so stated.

4.5 Except for the restrictions set forth in these specifications because of design limitations, the use and maintenance of this equipment is beyond the scope of the standard.

4.5.1 For this type of protective equipment, it is common practice and the responsibility of the manufacturer to provide instructions regarding proper use, care and maintenance of the equipment and for the user's employer to provide training in and procedures for the safe use of such equipment.

POLE AND TREE CLIMBERS

5. Classification

5.1 Climbers covered under these specifications shall be designated as Type A, B, or C, as follows:

5.1.1 *Type A*—Fixed length, non-adjustable, with permanently attached gaffs.

5.1.2 *Type B*—Adjustable length, with permanently attached gaffs.

5.1.3 *Type C*—Adjustable length, with replaceable and interchangeable gaffs (that is, pole to tree).

5.2 Climber straps covered under these specifications shall be designated as Type A or B, as follows:

5.2.1 *Type A*—One-piece straps that pass through the loops or rings on climbers and buckle one end to the other.

5.2.2 *Type B*—Two-piece ankle or bottom straps made so that each section can be attached to the climber ring, leaving the buckle end free to engage with the free billet end of the other piece.

6. Ordering Information

6.1 Orders for equipment under this specification shall include the following information:

6.1.1 Nomenclature,

6.1.2 Type,

6.1.3 Material,

6.1.4 Size, and

6.1.5 Gaff type (pole or tree).

6.2 The listing of equipment, types, and sizes is not intended to mean that all shall necessarily be available from the manufacturer; this listing signifies only that, if made, the equipment, types, and sizes shall conform to the details of these specifications.

7. Pole and Tree Climbers

7.1 *Sizes:*

7.1.1 Type A shall be available in sizes from 14 to 22 in. (355.6 to 558.8 mm) in ½ in. (12.7 mm) graduations.

7.1.2 Types B and C shall be available with the size adjustment capability of 14¾ to 21 in. (374.7 to 533.4 mm) by increments of ¼ in. (6.4 mm).

7.1.3 Adjustable climbers shall be equipped with positive locking, length-adjusting sections that can be double locked securely to the leg iron, permitting full compliance with standards established for fixed length climbers.

7.2 *Materials and Properties*—Leg irons shall be manufactured utilizing quality alloy steel, aluminum or titanium alloys. SAE 4140, SAE 8630 and SAE 8640 steel alloys with quenched and tempered structure, 2014 T6 aluminum alloy and Ti6AL4V titanium alloy are recommended. Other steel, aluminum and titanium alloys having properties listed in Table 1 are acceptable.

TABLE 1 Properties of Steel and Aluminum Alloys Acceptable for Climbers

	For Fixed Gaff Climbers	For Replaceable Gaff Climbers ^A
<i>Steel:</i>		
Elongation in 2 in. (5 cm), min	14 %	14 % ^A
Hardness	23 to 38 HRC	32 to 40 HRC ^A
	243 to 353 HB ^B	300 to 375 HB ^B
Yield strength, min, psi (MPa)	118 000 (815)	130 000 (895) ^A
<i>Aluminum:</i>		
Elongation in 2 in. (5 cm), min	...	10 %
Hardness	...	125 to 140 HB ^B
Yield Strength, min, psi (MPa)	...	65 000 (450)
<i>Titanium:</i>		
Elongation in 2 in. (5 cm), min	...	10 %
Hardness	...	30 to 40 HRC
	...	286 to 371 HB ^B
Yield Strength, min, psi (MPa)	...	120 000 (828)

^A Data from Federal Specification RR-C-430 C. (Cancelled)

^B Brinell hardness number with 3000-kg load, 10-mm ball.

7.3 *Processing*—If required, manufacturers shall use a heat treatment to provide the required characteristics of the leg iron. Overheating shall be avoided. Scaling, pitting, and surface decarbonization shall be removed on the inside critical section of the leg iron from 2 in. (50.8 mm) below the gaff to 6 in. (152.4 mm) above the gaff (see Fig. 3).

7.4 *Design*—The design of the climber shall be such that the maximum tensile stress at the point where maximum stress occurs when subjected to a fluctuating bending force of 300 lbf (1.34 kN) applied to the center of the stirrup section with sleeve in position shall be as indicated in the table below. The climber shall be held in the climbing position by the gaff and at the top of the climber with the sleeve extended to provide a 16 in. (406.4 mm) length.

Leg Iron	Max Tensile Stress, psi (MPa)
Type A—Steel	27 000 (185)
Type B—Aluminum	9 000 (60)
Type C—Titanium	27 000 (185)

7.5 *Finish*—Leg irons shall be free of surface cracks and seams. All steel leg irons shall be finished with a rust-resistant coating.

7.6 *Testing, Inspection and Marking:*

7.6.1 *Testing:*

7.6.1.1 *Deformation Test*—The purpose for this test is to aid in the elimination of climber failure in the event it is used in an unusual manner such as descending a pole with large steps. The climber shall be held rigidly in the climbing position with the top of the shank parallel to a mounting fixture, the stirrup freely suspended and perpendicular to the fixture. The climber equipped with a pole gaff must also be mounted at the gaff tip in a rigid surface to prevent gaff penetration. Gradually apply a static load of 750 lbf (3.3 kN) at the center of the stirrup and parallel to the fixture and hold for 3 min. Maximum deformation through any part of the climber shall not exceed 0.100 in. excluding measurement error after removal of the load. See Fig. 4.

7.6.1.2 *Fatigue Test*—When tested at room temperature (approx. 68°F), the climber as a minimum shall withstand without failure 100 000 cycles of a 300 lb (1334.5 N) load. The load must be applied parallel to the shank at the center of the stirrup section

FIG. 4 Deformation Test Fixtures

with sleeve in position. The climber equipped with a pole gaff shall be held in the climbing position by the gaff and at the top of the climber with the longest sleeve manufactured extended to provide maximum length. The gaff must be supported by a rigid surface so that the gaff will not penetrate the support. Failure shall be considered as any condition which renders the climber non-useable. See Fig. 5.

7.6.1.3 *Ductility Test*—(a) Leg iron: The leg iron shall withstand without fracture or cracking, a 180 degree bend about a 2 in. (51 mm) diameter mandrel near the midpoint of the shank area. (b) Gaff: The gaff shall withstand, without fracture, a cold bend in a direction away from the leg iron. The center of the bend shall be approximately 5/8 in. (16 mm) from the tip of the gaff. Permanent deflection of the tip of 3/8 in. (9.5 mm) with respect to the straight outer edge of the upper section shall be produced.

7.6.1.4 *Plane Test*—This test may be used to determine that the gaff is correctly shaped and sharpened to properly penetrate the pole. Place the climber on a flat, soft pine or cedar board. Holding it upright with the shank parallel to the board surface, but with no pressure on the stirrup, push the climber forward along the board as shown in Fig. 6a. If the gaff is properly shaped and sharpened and if the gaff angle with the wood is sufficient, the gaff point will dig into the wood and begin to hold within a distance of approximately 1 in. (2.54 cm). If the climber gaff slides along the wood without digging in, or merely leaves a mark or groove in the wood as shown in Fig. 6b. the gaff is either not properly sharpened and shaped or the gaff angle is too small. The gaff angle is built into the climber by the manufacturer and should be between 11 and 17 degrees with the climber placed parallel to the surface of the wood.

7.6.1.5 *Pole Cut Out Test*—This test shall be performed on a section of a treated (that is, creosote, penta, etc.) pole in an area that is free from knots and checks. Place the climber on your leg holding the sleeve with your hand. With your leg at an approximate 30° angle to the pole and your foot about 12 in. (30.5 cm) off the ground. Lightly jab the gaff into the pole to a depth of approximately ¼ in. (6.4 mm). Keep enough pressure on the stirrup to keep the gaff in the pole but not so much as to cause the gaff to penetrate any deeper. See Fig. 7a. Push the climber and your hand closer to the pole by moving your knee until the strap loop of the climber sleeve is against the pole. Make certain the strap loop is held against the pole with pressure from your leg. Gradually exert full pressure of your foot straight down on the stirrup without raising your other foot off the floor or ground, so as to maintain balance if the gaff does not hold. See Fig. 7b. The tip of the gaff shall cut into the wood and hold (dig itself in) in a distance of not more than 2 in. (5.1 cm), measured from the point of gaff entry into the pole to the bottom of the cut on the pole surface.

7.6.2 All climbers shall be subjected to careful inspection by the manufacturer. When requested, the manufacturer shall provide certification that the climbers meet all requirements set forth in these specifications.

7.6.3 Completed climbers shall be permanently marked by the manufacturer with the manufacturer’s name, ASTM F887 standard, size (if fixed size), right or left, and the month and year of manufacture. Right or left markings shall be in a visible area (that is, toe, stirrup) not covered by other equipment.

FIG. 5 Fatigue Test Fixture

FIG. 6 a & b Plane Test

FIG. 7 a & b Pole Cut Out Test

8. Climber Gaffs

8.1 *Sizes*—Pole gaffs shall measure at least $1\frac{1}{16}$ in. (36.5 mm) on the underside. Tree gaffs shall measure not more than $3\frac{1}{2}$ in. (88.9 mm), nor less than $2\frac{1}{4}$ in. (57.2 mm) on the underside. Gaff design shall be as shown in Fig. 8.

8.2 *Material*—All gaffs shall be forged of forging-quality steel having the properties listed in Table 2.

8.3 *Finish*:

8.3.1 All fins or burrs shall be removed from the cutting edges of gaff.

8.3.2 All gaffs shall be finished with a rust-resistant coating.

8.4 *Inspection*:

NOTE—Degree of angle of the gaff, measured as shown, shall range from 11° to 17° , and the point of the gaff shall be a minimum of $\frac{3}{8}$ in. (9.6 mm) above the lowest point of the climber stirrup. Tree gaffs are excluded from this requirement. The inside flat surface of the gaff at the tip shall be finished with a radius of approximately $\frac{1}{4}$ in. (6.4 mm) in accordance with the gage profile.

FIG. 8 Gaff Design

TABLE 2 Properties of Steel Alloy Acceptable for Gaffs

Elongation in 2 in. (5 cm), min	12 %
Hardness (tip)	45 to 55 HRC ^A 421 to 546 HB ^B
Yield strength, psi (MPa)	212 000 (1460)

^A There may be a variation of no more than three points in the Rockwell Hardness readings taken from the tip of the gaff to a point 1¼ in. (3.2 cm) back from the tip on the fixed gaff climber, 1 in. (2.5 cm) from the tip on replaceable gaff climbers.

^B Brinell hardness number with 3000-kg load, 10-mm ball.

8.4.1 All gaffs shall be subjected to careful inspection by the manufacturer. When requested, the manufacturer shall certify that the gaffs meet all requirements set forth in these specifications.

8.4.2 The size and shape of gaffs shall be checked with a gauge available from the same manufacturer.

NOTE 1—Replaceable gaffs, whether pole or tree, fit only the climber iron of the particular manufacturer.

9. Climber Straps

9.1 *Sizes*—Climber straps shall be a minimum of 1 in. (25.4 mm) in width and ⅛ in. (3.18 mm) in thickness. The length shall be not less than 22 in. (55.9 cm) for the calf strap, or 24 in. (61 cm) for the one-piece ankle strap. Two-piece ankle straps shall be not less than 24 in. (61 cm) in length.

9.2 *Material and Properties:*

9.2.1 Leather used in the manufacture of climber straps shall be top grain cowhide and shall have a breaking strength of not less than 450 lbf/in. (78.9 kN/m) of width with buckle holes. The buckle holding strength of leather shall be not less than 200 lbf (0.89 kN) static load when determined as follows:

9.2.1.1 Punch a hole ⅜ in. (4.76 mm) in diameter, centrally located in a 1 in. (25.4 mm) wide piece of strap, 1 in. (25.4 mm) from the end of the test piece. Into this hole, fit the tongue of a 1 in. assembled buckle of the design to be supplied with the climber strap. Apply the load to the buckle and to the free end of the strap. The buckle tongue shall not tear the leather under the specified static load of 200 lbf (0.89 kN).

9.2.2 The leather shall show no cracking on the grain side when bent slowly over a ½ in. (12.7 mm) diameter mandrel, grain side out, through an angle of 180°. The leather shall not show piping or wrinkling of the grain side when bent over a mandrel 1 in. (25.4 mm) in diameter, with the grain side in, through an angle of 180°.

9.2.3 Fabric used in the manufacture of climber straps shall have a breaking strength of not less than 600 lbf/in. (105.1 kN/m) of width with buckle holes. Construction shall be a minimum of four plies of thickness of folded nylon, or of woven nylon, or equivalent material, constructed in such a way that no raw edges are exposed. The fabric shall be impregnated with neoprene or its equivalent, so that the plies or strands are not readily separable, except by chemical means.

9.2.4 The buckle holding strength of the finished fabric strap shall be not less than 300 lbf (1.34 kN) static load without evidence of failure. Buckle tear shall be in the direction of load application when tested to failure.

9.3 *Hardware*—Buckle frames shall be of welded wire or forged construction. Tongues shall be of an adequate gage wire to meet the strength criteria of 9.2.

9.4 *Design*—Buckle holes in the climber straps shall not exceed ⅜ in. (4.76 mm) in diameter. Straps shall be riveted to the buckles by at least two rivets, with the strap keeper centered between the rivets. The completed assembly shall meet the strength requirements of 9.2. Buckle pads or chafes may be added when desired.

10. Climber Pads

10.1 Climber pad assemblies are intended for use with the climber to enhance comfort.

10.2 Velcro⁴ style wrap pads covered under these specifications cover the function of both the climber strap and pad.

10.3 *Materials*—Materials used in the manufacture of pads shall be of a type that will result in a finished product capable of meeting the requirements for this section outlined below.

10.3.1 Wrap style pads shall maintain a minimum wrap that shall not release at a force of less than 1000 lbf (4.45 kN) when statically tested.

10.3.2 Wrap style pads must display a minimum wrap location warning. Warning must be permanently attached (label or marking).

10.3.3 Sleeve retaining straps (see Fig. 9a) shall be a minimum of 1 in. (25.4 mm) in width. Leather sleeve retaining straps shall have a breaking strength of not less than 450 lbf/in. (78.9 kN/m) of width. Finished fabric sleeve retaining straps shall have a breaking strength of not less than 600 lbf/in. (105.1 kN/m) of width.

10.3.4 Sleeve retaining straps shall be capable of withstanding a direct pull of 175 lbf (0.78 kN). (See Fig. 9a).

10.3.5 Sleeve retaining straps in place within the climber sleeve shall be capable of withstanding a direct pull of 700 lbf (3.12 kN) (see Fig. 9b).

⁴ Velcro is a trademark of Registrant Velcro Industries, B.V. Limited Liability Company Netherlands, Castorweg 22–24, Curacao Netherld Antilles.

FIG. 9 a & b Sleeve Retaining Straps on Velcro Wrap Style Pads

11. Climber Footplates

ASTM F887-11

11.1 Climber footplate assemblies are intended for use with the climber to enhance comfort. [47283/astm-f887-11](https://standards.iteh.ai/47283/astm-f887-11)

11.2 *Materials and Properties*—Materials used in the manufacture of footplates shall be of a type that will result in a finished product capable of meeting the requirements for this section outlined below. Material used in the manufacture of footplates must maintain its integrity and resist permanent deformation under normal use conditions for the expected life of the product.

11.3 *Removable*—Footplates if removable shall be equipped with positive locking fasteners to secure the footplates to the climber stirrup.

11.4 *Articulation*—Footplates may swivel slightly on the climber stirrup to allow for ease of movement when working aloft.

11.5 *Shape*—Shape must be smaller than the outsole of a standard climbing boot while providing sufficient support to the outsole.

11.6 *Non-Skid*—Bottom surfaces of the footplate must be as a minimum 90 % covered by a rubber sole or an equivalent non-skid coating.

11.7 Steel footplates are not intended for and may not be used on aluminum climbers unless provisions are implemented to prevent premature wear on the climber.

11.8 Footplates shall be permanently marked by the manufacturer with the manufacturer's name, month and year of manufacture and designated as right and left.

11.9 *Finish*—Footplates shall be free of surface cracks and seams. All steel or ferrous material footplates shall be finished with a rust-resistant coating.

BODY BELTS, POSITIONING DEVICES AND WOOD POLE FALL RESTRICTION DEVICES (WPRFD)

12. Classification

12.1 Body belts covered under these specifications shall be designated as Type A or B, as follows:

12.1.1 *Type A*—Belt with dee-ring piece in fixed position.

12.1.2 *Type B*—Belt with dee-ring piece that has limited freedom of movement.

12.2 Positioning devices covered under this specification shall be designated as follows:

12.2.1 Positioning Straps:

- 12.2.1.1 Type A—Adjustable length, with tongue buckle.
- 12.2.1.2 Type B—Adjustable length, with friction buckle.
- 12.2.1.3 Type C—Nonadjustable length strap.

12.2.2 Adjustable Positioning Lanyard:

- 12.2.2.1 Type A—Adjustable length rope lanyard with Length Adjusting Device (LAD).
- 12.2.2.2 Type B—Web (woven nylon) lanyard with friction buckle, and
- 12.2.2.3 Type C—8 ft. retractable web, —6 to 10 ft retractable web.

12.3 WPF RD covered under these specifications shall be designated as Type A or AB as follows:

- 12.3.1 Type A—Equipment for use on dry, wet, conduit-covered poles as described in this specification.
- 12.3.2 Type AB—Equipment is for use on dry, wet, conduit-covered, and icy poles as described in this standard.

13. Ordering Information

13.1 Orders for equipment under these specifications should include the following information:

- 13.1.1 Nomenclature,
- 13.1.2 Type,
- 13.1.3 Style,
- 13.1.4 Material, and
- 13.1.5 Size.

13.2 The listing of equipment, types, styles, and sizes is not intended to mean that all shall necessarily be available from the manufacturer. The listing signifies only that, if made, the equipment, types, styles, and sizes shall conform to the details of these specifications.

14. Body Belts

14.1 Sizes—The “dee” measurement will be the nominal distance from the heel or bar of one dee ring to the heel or bar of the other dee ring (see Fig. 10). Body belts shall be marked with the “dee” sizes since the dee size is the most critical. Body belts are normally furnished in the combination belt strap and dee sizes listed in Table 3 (see Fig. 11), however, belt strap measurements may vary on different style belts and with different manufacturers.

14.2 Materials:

14.2.1 Leather—Top grain leather or leather substitute may be used in the manufacture of body belts and accessories, but shall not be used alone as a load bearing component of the assembly.

14.2.2 Fabric—Plied fabric used in the manufacture of load bearing parts of body belts shall be constructed in such a way that no raw edges are exposed. Fabric shall be impregnated with neoprene, or its equivalent, so that the plies are not readily separable, except by chemical means. If webbing is used, it need not be impregnated.

14.3 Design:

14.3.1 Body Pad—The cushion part of the body belt shall contain no exposed rivets on the inside and shall be at least 3 in. (76.2 mm) in width. The belt shall have pocket tabs extending at least 1 1/2 in. (38.1 mm) down, and with the point of attachment at least 3 in. (76.2 mm) back of inside of the circle of dee-rings on each side for attachment of plier or tool pockets (see Fig. 12). On shifting dee belts, the measurement for pocket tabs shall be taken when the dee ring section is centered.

14.3.2 Belt Straps—Belt straps shall be made of fabric described in 14.2.2. Buckle holes shall be spaced on 1 in. (25.4 mm) centers, round or oval, to accommodate the tongue of the belt buckle. Buckle holes shall be shaped not in excess of 1/4 in. (6.3 mm) in diameter if round, or 1/4 by 3/8 in. (6.3 by 9.5 mm) if oval shaped, the greater dimension to be in the direction of the length of the strap. For grommet construction, holes shall be no larger than No. 2 grommet. No hole shall be permitted within 4 in. (101.6 mm) of the end of the strap. The nominal body strap width shall be 1 3/4 in. (44.5 mm) (see Fig. 13).

14.3.3 Tool Loops—Tool loops shall be so situated on the body of the belt that 4 in. (101.6 mm) of the body belt in the center of the back, measuring from dee-ring to dee-ring, shall be free of tool loops and any other attachments (see Fig. 12). The material may be either leather or fabric 1/8 in. (3.18 mm) thick, 1 in. (25.4 mm) nominal width, with the loops having a maximum diameter of 1 3/4 in. (44.4 mm) and a minimum diameter of 3/4 in. (19.1 mm). If a hammer loop is desired, it should be ordered in the position nearest the belt buckle.

FIG. 10 “Dee” Measurement

TABLE 3 Available Body Belts Listed by Dee Size With Corresponding Belt Strap Size

Dee Size		Min		Center Hole		Max		No. of Tool Loops
in.	cm	in.	cm	in.	cm	in.	cm	
D18	46	32	81	36	91	40	102	3
D19	48	33	84	37	94	41	104	3
D20	51	34	86	38	97	42	107	3
D21	53	36	91	40	102	44	112	4
D22	56	37	94	41	104	45	114	4
D23	58	38	97	42	107	46	117	4
D24	61	40	102	44	112	48	122	4
D25	64	41	104	45	114	49	124	4
D26	66	42	107	46	117	50	127	4
D27	69	44	112	48	122	52	132	4
D28	71	45	114	49	124	53	135	4
D29	74	46	117	50	127	54	137	4
D30	76	47	119	51	130	55	140	4

X— Distance from waist or top of hip bone to where body belt is worn.
 Y— Measurement is from front of hip bone around the back to the front of the other hip bone. This measurement is the Dee size.

FIG. 11 A Method Showing Where to Measure to Determine Correct “Dee” Size for a Body Belt

FIG. 12 Body Belt Nomenclature

14.3.4 *Circle Dee-Rings*—The design of the dee-ring (see Fig. 1) shall be such that its minimum inside circle to outside circle opposite side dimension is $3/8$ in. (79.4 mm), it is straight-sided and it shall not have any obstructions, protrusions, or a configuration that can allow pressure to be put on the snaphook keeper. The dee-ring strap and the body strap shall not pass through or attach to that part of the dee-ring to which the positioning strap snaphooks are engaged. The dee-rings shall be installed in the body belt in such a manner that vertical travel in the assembly is prevented.

14.3.5 *Liners for Dee-Rings*—Suitable copper, steel, or equivalent liners shall be used around the bar of dee rings to prevent wear.

14.3.6 *Stitching and Thread*—All stitching shall be of nylon or equivalent thread and shall be lock stitched, not less than three nor more than seven stitches to the inch. The thread shall have a minimum breaking strength of 42 lbf (186.83 N). Stitching parallel to an edge shall be approximately $3/16$ in. (4.8 mm) from the edge of the narrowest member caught by the thread.
