Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 171, *Document management applications*, Subcommittee SC 1, *Quality, preservation and integrity of information*.

This first edition cancels and replaces ISO/TS 19475-1, ISO/TS 19475-2, and ISO/TS 19475-3.

Any feedback or questions about this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

This document specifies the minimum requirements for the operation of a document management system necessary to maintain authenticity, integrity and readability of those managed documents.

Overall business operations are composed of the functions of receiving the document(s), performing the work processes according to its contents, reporting the results of the processes and delivering an outcome. A document management system serves the basic purpose of controlling the handling of the received document, establishing the work processes and delivering the result of those processes. Therefore, the reliability of the business processes and the process itself heavily depend on the reliability of the document used as well as the reliability of the document management system.

The following operations are specified in this document, which relate to maintaining the reliability of business activities:

- an operation that maintains the reliability of the received documents;
- an operation that maintains the integrity of the process activities; and
- an operation that ensures the authenticity of the delivered documents.

The reliability of the work processes is demonstrated by the effectiveness evaluation of the internal controls of the organizations. Management is responsible for creating evidence during the organization's business activities, ensuring and maintaining authenticity and integrity of the documents. Retained documents produced as evidence of work are audited and assessed for validity. The framework and the controls for preserving documents are described in ISO 15489.

ISO 14641 describes the methods for storing created or received electronic documents and provides the guidelines for maintaining their integrity.

An electronic document management system (EDMS) is an effective technology for handling storage to ensure the reliability of documents processed internally in an organization.

The above-mentioned mechanisms are a useful foundation for demonstrating the integrity of work processes.

However, in executing their business operations, organizations create or receive various types of documents and deliver them to other organizations. Sharing documents has the potential for a variety of risks.

There is the risk that the organization can receive a document without any right to use it. There is also the risk that the document contains false information, that the information was received through inappropriate communication channels or, that the information is inappropriate for business purposes. Any of these circumstances degrade the reliability of the work processes.

There are also risks involved when delivering a document to another organization. For example, it can be delivered to the wrong party or the information is not appropriate to be shared. Organizations need to take the necessary steps to mitigate these risks.

Organizations need to clarify their handling process procedures for receipt and delivery of documents. Document handling procedures need to include quality criteria for the documents to be processed.

By applying the controls described in this document, an organization can operate their document management system appropriately.

Document management — Minimum requirements for the storage of documents

1 Scope

This document specifies the minimum requirements necessary to maintain the authenticity, integrity and readability of documents managed by an electronic document management system. Clarifying the methods and procedures for appropriately handling electronic documents promotes the usability of the documents, in both a legal and business context.

This document expresses a general business process as a document handling process. The document handling processes include receiving, processing and delivering the documents as follows:

- approving the receipt of a document in a manner that is appropriate for a work process;
- storing the formal document in the work process environment;
- delivery of the document to another organization.

This document establishes the controls for execution of the work processes while maintaining the authenticity and integrity of the document received.

This document establishes the policies for the storage of documents used as part of the work process. It also details the controls for performing the receipt and conversion process appropriately.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes the requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

4 General

4.1 Policy

This document specifies the minimum requirements for the handling of electronic documents in the framework of a business process. Storage of the document(s) involved with the general handling processes are controlled in accordance with EDMS and ECM requirements (see [Annex A](#)). The preservation and maintenance of the evidential value of the information used in business processes are in accordance with the preservation system specified in ISO 14641.

This document describes a document handling process. The document handling process includes, but is not limited to, receipt, processing and delivery of documents. The relationships are shown in [Figure 1](#).

When a document is received, the receiving organization stores it and, if necessary, sets the data format and form appropriate for the processing process.

Each receiving organization stores the document in a storage system so that the change history of the document throughout the handling process is securely maintained. Maintaining a log of the handling process in the preservation system also is required.

After processing is complete, if necessary, the delivering organization formats the document appropriately for the recipient's use. The organization sending the document transfers or shares it to another organization.

The integrity of a delivered document should be tracked throughout the document processing process. Therefore, organizations can use work-related documentation to fulfil accountability.

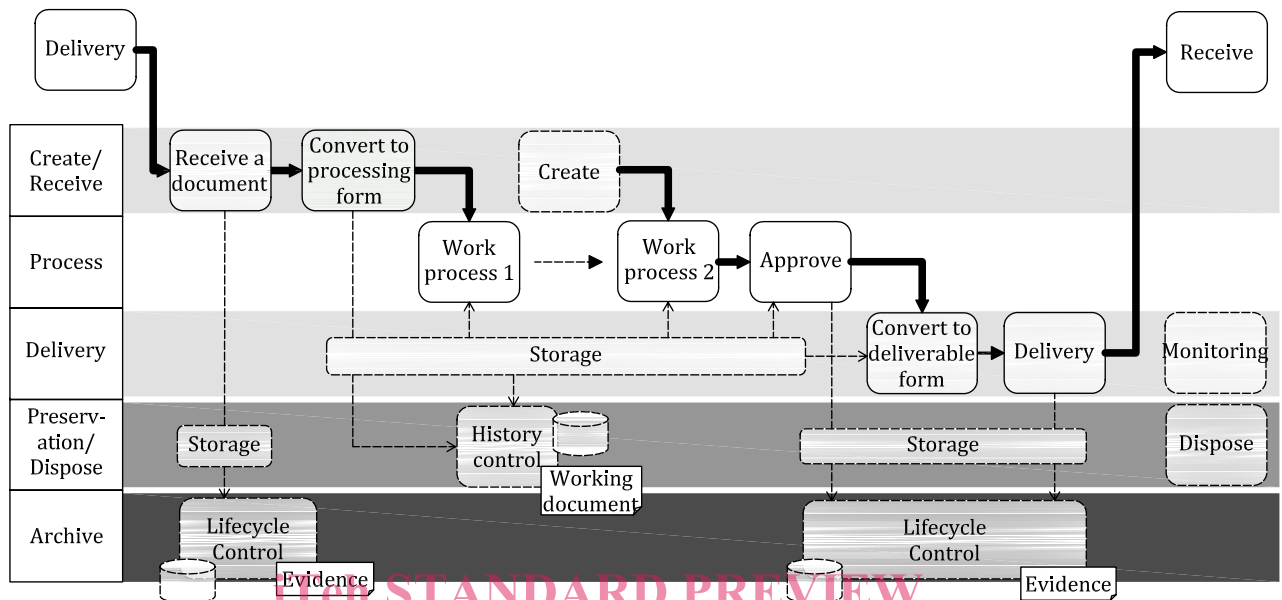

Figure 1 — Document handling processes

The organization validates that the document received contains the information required for processing, and whether the organization had the right to receive it. After the document is received, it can be converted into a format appropriate for handling. There is also a process for the verification that the conversion was made accurately.

The organization review documents that are created or received by following the specified processes. These processes include checks that confirm the integrity of the processing results and approved the document.

The approved document may be reformatted as appropriate for the recipient's use prior to delivery. The delivered document is then stored within the preservation system. The delivered document is monitored in terms of use, transfer, copying, updates and disposal.

By handling the document according to the methods described in this document, the integrity of document handling is assured.

4.2 Document types

Types of document to be received by the organization are as follows:

- in paper form, such as an application document;
- a scanned electronic document from an original hard copy or photograph (.jpeg image), etc.;
- a document that was packaged with other forms of data (office systems, CAD, etc.);
- a document extracted from database information using an application program interface (API);
- a document obtained through a network via API (in this case, the document is not actually moving);
- a document that is part of a data stream.

Each type of information needs a different type of control. Therefore, having specific controls for each type reduces the risk of losing information or creating an error.

4.3 Controlling a received and delivered document

To maintain the quality of the handling process, the integrity of the document received and delivered shall be confirmed.

This is critical to ensure the integrity and reliability of the receipt the document, converting where appropriate into a usable format and this approving the deliverable form and delivery processes of the document.

To maintain reliability of these processes, manage the document as follows:

- define the type of document to be handled;
- define the handling procedure for each type of document;
- note the context of the handling process so that each process can be audited;
- when any problems are found during an audit, conduct correction and improvement actions.

NOTE “Context” is defined as information related to the document handling history. Examples include the document author, references, update log, handling logs related to processing, etc.

4.4 Risks in document handling and measures

4.4.1 Receipt and conversion

An organization receives and, where necessary, converts the documents it receives into a format that is appropriate for use in the organization. This document is then used according to the handling process specified in this document.

This subclause describes the risks associated with the organization responsible for receiving and converting the documents.

Examples of the risks are as follows:

- an organization can receive a document that it does not have the right to use;
- an inadequate decision can be taken if inappropriate documentation is processed
- incorrect worker assignments can cause information leakage and false information;
- when authenticity of the document received is not confirmed, it is not possible to maintain the integrity of the documentation process and the delivered documents.

4.4.2 Recipient and delivery

This subclause describes the risks associated delivery processes.

Examples of the risks are as follows:

- the delivery of the document is inconsistent with the work process (tampering);
- inappropriate documents are delivered (error);
- the document is delivered to unauthorized users;
- the document is destroyed while in use.

5 Receipt and approval

5.1 Requirements

Organizations should define handling methods for each type of document to properly control the documents they receive.

The type of document and the handling methods are defined according to the receiving policy and the contract with the vendor or customer.

NOTE The type of document is defined by its use and purpose. The format of the document is defined by its handling method.

5.2 Controls for receipt

The organization shall confirm the skill level of the person responsible for receiving the document before giving the work order.

The organization shall confirm whether it has the rights and privileges to receive and use a received document.

An organization shall not receive types of document they do not have the rights and privileges to use.

The organization shall maintain the integrity of the document received and approved in accordance with its purpose for processing.

The organization shall maintain the quality of the equipment involved in the receiving and approval processes.

When outsourcing receipt duties to another organization, care shall be taken to avoid receiving documents not authorized to be outsourced.

NOTE The authenticity and reliability of the document received is either confirmed by such public credibility information as an electronic signature or time stamp, or the organizational trust or credibility of the party who sent the information.

5.3 Controls for approval

Controls for the approval process of the document received from an outside organization into a format appropriate for the document handling process are explained below.

Approval processes for the purpose of conversion include digitizing a paper document received, registering or duplicating the document, whether received in paper form or an electronic file, and deploying a data file received into processing.

NOTE Security risks in terms of physical security or system security are not discussed in this document. Please refer to the relevant IT security standards.

When converting a document into a format that is appropriate for processing, the organization should ensure that the information content of the received document and the converted document are not compromised.

During the receipt process, handling shall be suspended if the information includes a document that is not able to be approved. When the receipt process is suspended, the organization shall store the information in question and return the relevant document to the sender.

NOTE See [Annex B](#) for the controls for inspection of the document format received.

5.4 Document to be used at processing

Metadata shall be extracted from the received document that will be used during processing.
