Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 44, *Welding and allied processes*, Subcommittee SC 8, *Equipment for gas welding, cutting and allied processes*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 121, *Welding and allied processes*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This third edition cancels and replaces the second edition (ISO 15615:2013), which has been technically revised.

The main changes are as follows:

- the manual quick-acting shut-off valve has been removed because it is no longer state of the art;
- the remotely actuated shut-off valve has been removed because it is no longer state of the art;
- in [3.8](#) the definition of change-over unit has been added;
- in [5.2.6](#) a requirement has been added;
- in [5.3.4](#) the additional requirements for three-way valves have been clarified;
- in [5.3.6](#) specific requirements for pressure gauges have been added;
- new [subclause 6.4](#) on external gas leakage test has been added;
- in [6.7.2](#) tolerances have been added;
- in [6.7.3](#) a minimum value for vacuum has been added;
- in [6.7.4.4](#) the test conditions for three-way valves have been clarified;
- in [6.8.2](#) other comparable test methods for leakage have been permitted;
- in [6.8.3](#) a minimum settling time of pressure has been added;

— in [Clause 8](#) the kind of device has been added to the marking.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html. Official interpretations of ISO/TC 44 documents, where they exist, are available from this page: <https://committee.iso.org/sites/tc44/home/interpretation.html>.

iTeh STANDARD PREVIEW (standards.iteh.ai)

ISO 15615:2022

<https://standards.iteh.ai/catalog/standards/sist/e15c75c1-b1b8-4408-8007-d44f48ea5028/iso-15615-2022>

Gas welding equipment — Acetylene manifold systems for welding, cutting and allied processes — Safety requirements in high-pressure devices

1 Scope

This document establishes the general specifications, requirements and tests for devices located on the high-pressure side of acetylene manifold systems up to 2,5 MPa (25 bar)¹⁾ as defined in ISO 14114. It does not apply to high-pressure piping, high-pressure flexible hoses or pressure regulators.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 5171, *Gas welding equipment — Pressure gauges used in welding, cutting and allied processes*

ISO 9090, *Gas tightness of equipment for gas welding and allied processes*

ISO 9539, *Gas welding equipment — Materials for equipment used in gas welding, cutting and allied processes*

ISO 10297, *Gas cylinders — Cylinder valves — Specification and type testing*

ISO 15296:2017, *Gas welding equipment — Vocabulary*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 15296 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1

non-return valve

device that prevents passage of gas in the direction opposite to the intended flow

[SOURCE: ISO 15296:2017, 3.4.2]

3.2

automatic quick-acting shut-off device

self-acting device that closes quickly, for example when triggered by an acetylene decomposition in the high-pressure manifold pipework

[SOURCE: ISO 15296:2017, 3.4.10, modified — Definition revised.]

1) 1 bar = 0,1 MPa = 10⁵ Pa; 1 MPa = 1 N/mm².

3.3

automatic pressure-actuated shut-off valve

device that automatically stops the gas supply to the regulator when the downstream pressure rises above the maximum operating pressure

Note 1 to entry: The terms “upstream”, “upstream side”, “downstream” and “downstream side” in this document refer to the intended direction of gas flow in the device.

3.4

three-way valve

device that can be manually or automatically actuated and allows gas flow from one side or the other, but not both sides, of the high-pressure manifold to enter the regulator while isolating flow from the other side

3.5

stop valve

device that prevents the flow of gas when closed

3.6

multifunctional safety device

device that incorporates two or more of the safety functions

[SOURCE: ISO 15296:2017, 3.4.8]

3.7

pressure gauge

device that shows the actual pressure of the assembly (digital or analogue readouts), for example used in the high-pressure line of manifold systems

3.8

change-over unit

device in a two-sided system allowing switching the supply of gas to the system from either its bank of cylinders or bundles by means of a pressure-actuated switching mechanism without interrupting the supply

[SOURCE: ISO 14114:2017, 3.7, modified — Definition revised and note to entry deleted.]

4 Design

Components within the devices should be designed to remain at the same electrostatic potential as the body of the device during operation. All metal components in contact with gas should be electrically continuous to prevent static electricity discharges.

5 Requirements

5.1 General

The general requirements (see 5.2) apply to all the devices defined in [Clause 3](#). The multifunctional safety devices shall meet the general and additional requirements corresponding to each function.

All flow and leakage rate figures in this document shall be specified and measured under normal conditions [0,101 3 MPa (1,013 bar), 23 °C].

5.2 General requirements

5.2.1 Materials

Materials used for devices shall be in accordance with ISO 9539.

5.2.2 External gas leakage

The general requirements on external gas leakage shall be in accordance with ISO 9090 before and after the tests except for the pressure resistance test. See [6.4](#) for test details.

5.2.3 Internal gas leakage

Where internal gas leakage is named in this document, the leakage rate shall not exceed 50 cm³/h for devices with a connection internal bore (diameter) less than 11 mm or less than $0,41d^2$ for larger diameters. See [6.5](#) for test details.

NOTE The expression $0,41d^2$ gives the value of the flow in cm³/h, where d is the internal bore (diameter), in mm, of the largest connection in the device.

5.2.4 Internal gas leakage after decomposition test

Where internal gas leakage after acetylene decomposition is named, the leakage rate shall not exceed 50 l/h (see [6.5](#) for test details).

5.2.5 Pressure resistance

The housings of the devices shall withstand a pressure of 31,5 MPa (315 bar) for 5 min without any observed leakage. After pressurization, there shall be no visible permanent deformation (see [6.6](#) for test details).

5.2.6 Acetylene decomposition

After the device has been tested with decomposition at 2,5 MPa (25 bar) initial pressure in accordance with [6.7](#), there shall be no visible permanent deformation of the device. No escape of gas shall occur during the test. No part shall be ejected. Destruction of inner parts is permitted.

5.3 Additional requirements to be met by specific types of devices

5.3.1 Non-return valve

Non-return valves shall not allow the reverse flow of gas greater than 150 cm³/h (0,15 l/h) when tested with a back pressure of 0,05 MPa (0,5 bar) and 2,5 MPa (25 bar) in accordance with [6.8.2](#), before and after the 2 000-cycle fatigue test carried out in accordance with [6.8.3](#).

These requirements do not apply to the non-return valve after it has been subjected to the acetylene decomposition test.

5.3.2 Automatic quick-acting shut-off device

Automatic quick-acting shut-off devices shall be triggered by an acetylene decomposition at 0,6 MPa (6 bar) and 2,5 MPa (25 bar) and shall fulfil the requirements of [5.2.6](#). After tripping by acetylene decomposition, the internal gas leakage shall meet the requirements of [5.2.4](#).

5.3.3 Automatic pressure-actuated shut-off valve

Automatic pressure-actuated shut-off valves shall be triggered (stop gas flow on high-pressure side) at a pressure on the low-pressure signal port between 0,16 MPa and 0,20 MPa (1,6 bar and 2,0 bar) at both 0,1 MPa and 2,5 MPa (1 bar and 25 bar) on the high-pressure side. When triggered, the internal gas leakage shall meet the requirements of [5.2.3](#). See [6.10.3.1](#) (test 1) and [6.10.3.2](#) (test 2) for details.

The valve shall not be triggered when a pressure of 0,145 MPa to 0,150 MPa (1,45 bar to 1,50 bar) is held on the low-pressure signal port for 168 h. See [6.10.3.3](#) (test 3) for details.

Once actuated (closed), it shall not be possible for the valve to reset to an open condition without manual intervention.

In addition to the 31,5 MPa (315 bar) pressure resistance test on high-pressure chambers in [5.2.5](#), the internal chambers of the low-pressure signal port shall withstand a pressure of 6,0 MPa (60 bar) for 5 min. During pressurization, there shall be no visible permanent deformation or leakage to the atmosphere.

Automatic pressure shut-off valves shall meet the requirements of [5.2.3](#) before the decomposition test (see [6.7](#)) and after the endurance test (see [6.9](#)).

5.3.4 Three-way valve

Three-way valves, when closed, shall meet the requirements of [5.2.3](#) before the decomposition test (see [6.7](#)) and after the endurance test (see [6.9](#)) and the requirements of [5.2.4](#) after the decomposition test.

Additional requirements for the decomposition test (see [6.7.4.4](#)):

Sample 1: The three-way valve shall prevent the decomposition from passing through the isolated inlet of the valve.

Sample 2: The three-way valve shall prevent the decomposition from passing through the isolated part of the valve.

Sample 3: The three-way valve shall prevent the decomposition from passing through the isolated, intended upstream side of the valve.

5.3.5 Stop valve

In the closed position, stop valves shall meet the requirements of [5.2.3](#) before the decomposition test (see [6.7](#)) and after the endurance test (see [6.9](#)). After the decomposition test, the stop valves shall meet the requirements of [5.2.4](#).

During the acetylene decomposition test, the stop valve shall prevent the decomposition from passing downstream of the valve.

For valves with handwheels, the closing torque applied for the decomposition test shall be the endurance test torque as defined in the endurance test for cylinder valves in ISO 10297.

5.3.6 Pressure gauge

If the pressure gauge is a Bourdon-tube pressure gauge, it shall fulfil the functions and safety requirements specified in ISO 5171 in addition to the requirements of this document.

6 Type testing

6.1 General

The type test methods of [6.2](#) to [6.10](#) shall be applied to sample devices to be tested for conformity with this document. Tests shall be carried out on new devices. The test order shall be carried out as specified in [Annex A, Table A.1](#).

6.2 Reference values and accuracy of instruments

The accuracy of the pressure-measuring instrument shall be within $\pm 3\%$ of the measured value. For this purpose, the maximum measuring range (full scale) and class of the pressuremeasuring instrument to be used shall be selected appropriately.

All pressures shall be given in megapascals (MPa) and in bars (bar). If the temperature at the test assembly is outside the range of $(20 \pm 5) ^\circ\text{C}$, the pressure shall be corrected in accordance with the ideal gas law. Consequently, the test shall be carried out at low temperatures with a lower initial pressure and at high temperatures with a higher initial pressure. The minimum temperature shall be $5 ^\circ\text{C}$.

6.3 Test gases

The decomposition test shall be carried out with an acetylene supply source of purity of at least 99,5 %. All other tests shall be carried out with oil-free nitrogen or air.

6.4 External gas leakage

Conformity with the requirements of [5.2.2](#) shall be checked

6.5 Internal gas leakage test

With the device under test in the closed condition, connect the upstream side to a gas source at the maximum operating pressure, with the downstream side open to the atmosphere. Check that any internal gas leakage at the device outlet meets the requirements of [5.2.3](#) and [5.2.4](#). The procedure of measurement of the leakage rate shall be carried out in the same manner as specified in ISO 9090.

6.6 Pressure resistance test

One sample shall be checked against the requirements of [5.2.5](#) by means of a hydraulic-pressure test. No other tests shall be carried out on the sample either before or after this test. The sample tested shall not be used for any other purpose.

6.7 Acetylene decomposition test

6.7.1 General

Three samples shall be checked against the requirements of [5.2.6](#). The device shall be installed in the test set-up given in [Figure 1](#), so the decomposition is initiated on the upstream side (if a flow direction is given).

6.7.2 Test conditions

The devices shall be checked as follows using a test set-up as shown in [Figure 1](#) or [Figure 2](#):

- tube length between key 2 and key 3 (l_1) of [Figure 1](#): $100 \text{ mm} \pm 3 \%$;
- ignition tube length (l_2): $5 \text{ m} \pm 3 \%$;
- tube length (l_3): $1 \text{ m} \pm 3 \%$;
- for samples with an inner diameter of connection up to 10 mm, the internal diameters of the tubes (key 4 of [Figure 1](#) and [Figure 2](#)) shall be $10 \text{ mm} \pm 0,5 \text{ mm}$;
- for samples with an inner diameter of connection larger than 10 mm, the internal diameters of the tubes (key 4 of [Figure 1](#) and [Figure 2](#)) shall be equal to or larger than the inner diameter of connection, but not larger than 1,2 times the inner diameter of connection;
- industrial acetylene, static gas phase;
- ignition by fusible metal wire, ignition energy less than 100 J.
