

Designation: ~~C1088-10~~ Designation: C1088 – 11

## Standard Specification for Thin Veneer Brick Units Made From Clay or Shale<sup>1</sup>

This standard is issued under the fixed designation C1088; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reappraisal.

### 1. Scope\*

1.1 This specification covers thin veneer brick units made from clay, shale, fire clay, sand, or mixtures thereof, and fired to incipient fusion for use in adhered or fastened veneer applications. Three types of thin veneer brick units in each of two grades are covered. In this specification, the term thin veneer brick shall be understood to mean clay masonry unit with a maximum thickness of 1¾ in. (44.45 mm).

NOTE 1—Brick intended for paving should be specified under Specification C902.

1.2 The property requirements of this specification apply at the time of purchase. The use of results from testing of brick extracted from masonry structures for determining conformance or nonconformance to the property requirements (Section 5) of this specification is beyond the scope of this specification.

1.3 Brick covered by this specification are manufactured from clay, shale, or similar naturally occurring substances and subjected to a heat treatment at elevated temperatures (firing). The heat treatment must develop sufficient fired bond between the particulate constituents to provide the strength and durability requirements of the specification. (See “firing” and “fired bond” in Terminology C1232.)

1.4 The text of this specification references notes and footnotes which provide explanatory material. These notes and footnotes (excluding those in tables and figures) shall not be considered as requirements of the standard.

1.5 The values stated in inch-pound units are to be regarded as standard. The values given in parentheses are mathematical conversions to SI units that are provided for information only and are not considered standard.

### 3. Grades—Classification

3.1 Two grades of thin veneer brick units are covered for exposure conditions to weather and are defined in Table 1 as Interior and Exterior.

3.2 Three types of thin veneer brick units are covered as follows:

3.2.1 Type TBS (Standard)—Thin veneer brick for general use in masonry.

3.2.2

3.2.2 Type TBX (Select)—Thin veneer brick for general use in masonry where a higher degree of precision and lower permissible variation in size than permitted for Type TBS is required.

3.2.3

3.2.3 Type TBA (Architectural)—Thin veneer brick for general use in masonry selected to produce characteristic architectural effects resulting from nonuniformity in size and texture of the individual units.

4.2 When the type is not specified, the requirements for Type TBS will govern.

3.3 When the type is not specified, the requirements for Type TBS will govern.

<sup>1</sup> This specification is under the jurisdiction of ASTM Committee C15 on Manufactured Masonry Units and is the direct responsibility of Subcommittee C15.02 on Brick and Structural Clay Tile.

Current edition approved June 1, 2010. Published July 2010. Originally approved in 1988. Last previous edition approved in 2009 as C1088-09a. C1088 – 10. DOI: 10.1520/C1088-10.

\*A Summary of Changes section appears at the end of this standard.

**TABLE 1 Physical Requirements**

Designation	Maximum Water Absorption by 5-h Boiling, %		Maximum Saturation Coefficient <sup>A</sup>	
	Average of 5 units	Individual	Average of 5 units	Individual
Grade Exterior	17.0	20.0	0.78	0.80
Grade Interior	22.0	25.0	0.88	0.90

<sup>A</sup> The saturation coefficient is the ratio of absorption by 24-h submersion in cold water to that after 5-h submersion in boiling water.

#### 4. Materials and Manufacture

4.1 Units shall not show surface defects and deficiencies, nor effects of surface treatments including coating in the manufacturing process, that interfere with installation of the brick or significantly impair the performance of the construction.

4.2 Colors and textures produced by application of inorganic coatings to the faces of the thin veneer brick are permitted if approved by the purchaser, provided that evidence is furnished of the durability of the coatings.

#### 5. Physical Properties

5.1 *Durability*—The thin veneer brick shall conform to the physical requirements in Table 1 for the grade specified. When the grade is not specified, the requirements for Grade Exterior shall govern. If the water absorption of each unit is less than 8.0 % after submersion in cold water for 24 h, the requirements for saturation coefficient shall be waived. If exterior or interior grade thin veneer brick are intended for use on interiors only, the requirements for water absorption (5-h boiling) and for saturation coefficient for interior grade in Table 1 shall govern.

NOTE 2—A minimum compressive strength requirement is not included in combination with other physical property requirements as an indicator of freeze/thaw durability. The geometry of the thin brick units may preclude proper testing and can affect the failure mode attained. Thus, compressive strength test results may not be a true indicator of unit freeze-thaw performance or fired bond.

5.2 *Freezing and Thawing*—The requirements specified in 5.1 for water absorption (5-h boiling) and saturation coefficient shall be waived provided a sample of 5 typical exterior grade thin veneer brick, meeting all other requirements, complies with the following requirements when subjected to 50 cycles of the freezing-and-thawing test:

5.2.1 *Grade Exterior: Breakage and Weight Loss Requirement*—No individual unit separates or disintegrates resulting in a weight loss greater than 0.5 % of its original dry weight.

5.2.2 *Grade Exterior: Cracking Requirement*—No individual unit develops a crack that exceeds, in length, the unit's least face dimension.

5.3 *Low Weathering Index Alternative*—If the thin brick are intended for use exposed to weather where the weathering index is less than 50 (see Fig. 1), and unless otherwise specified, the requirements given in Table 1 for grade interior shall apply.
