This document is not an ASTM standard and is intended only to provide the user of an ASTM standard an indication of what changes have been made to the previous version. Because it may not be technically possible to adequately depict all changes accurately, ASTM recommends that users consult prior editions as appropriate. In all cases only the current version of the standard as published by ASTM is to be considered the official document.

Designation: E230–03 Designation: E230/E230M – 11

An American National Standard

Standard Specification and Temperature-Electromotive Force (EMF)(emf) Tables for Standardized Thermocouples¹

This standard is issued under the fixed designation E230/E230M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

Note—Paragraph 1.1, and Tables7, 13, 19, 21, and 46 were editorially corrected and the year date changed on Sept. 23, 2003.

1. Scope

1.1 This specification contains reference tables (Tables 8– to 25) that give temperature-electromotive force (emf) relationships for Types B, E, J, K, N, R, S, T, and C thermocouples.² These are the thermocouple types most commonly used in industry.

1.2Also included are lists of standard and special tolerances on initial values of emf versus temperature for thermocouples (Table1), thermocouple extension wires (Table2), and compensating extension wires for thermocouples (Table3).

1.3Tables4–5, included herein, give data on insulation color coding for thermocouple and thermocouple extension wires as eustomarily used in the United States. These are the thermocouple types most commonly used in industry. The tables contain all of the temperature-emf data currently available for the thermocouple types covered by this standard and may include data outside of the recommended upper temperature limit of an included thermocouple type.

1.2 In addition, the specification includes standard and special tolerances on initial values of emf versus temperature for thermocouples (Table 1), thermocouple extension wires (Table 2), and compensating extension wires for thermocouples (Table 3). Users should note that the stated tolerances apply only to the temperature ranges specified for the thermocouple types as given in Tables 1, 2, and 3, and do not apply to the temperature ranges covered in Tables 8 to 25.

<u>1.3</u> Tables 4 and 5 provide insulation color coding for thermocouple and thermocouple extension wires as customarily used in the United States.

1.4 Recommendations regarding upper temperature limits for the thermocouple types referred to in 1.1 are givenprovided in Table 6.

1.5 Tables 26-<u>to</u> 45 give temperature-emf data for single-leg thermoelements referenced to platinum (NIST Pt-67). The tables include values for Types BP, BN, JP, JN, KP (same as EP), KN, NP, NN, TP, and TN (same as EN).

1.6 Tables for Types RP, RN, SP, and SN thermoelements are not included since, nominally, Tables 18– to 21 represent the thermoelectric properties of Type RP and SP thermoelements referenced to pure platinum. Tables for the individual thermoelements of Type C are not included because materials for Type C thermocouples are normally supplied as matched pairs only.

1.7. Polynomial coefficients that which may be used for computation of thermocouple emf as a function of temperature are given in Table 7. Coefficients for the emf of each thermocouple pair as well as for the emf of most individual thermoelements versus platinum are included. Coefficients for type RP and SP thermoelements are not included since they are nominally the same as for the types R and S thermocouples, and coefficients for type RN or SN relative to the nominally similar Pt-67 would be insignificant. Coefficients for the individual thermoelements of type Type C are thermocouples have not been established.

1.8 Coefficients for sets of inverse polynomials are given in $\frac{\text{Table 44. Table 46.}}{\text{Table 46.}}$ These may be used for computing a close approximation of temperature (°C) as a function of thermocouple emf. Inverse functions are provided only for thermocouple pairs and are valid only over the emf ranges specified.

1.9 This specification is intended to define the thermoelectric properties of materials that conform to the relationships presented in the tables of this standard and bear the letter designations contained herein. Topics such as ordering information, physical and mechanical properties, workmanship, testing, and marking are not addressed in this specification. The user is referred to specific standards such as Specifications E235, E574, E585/E585M, E608, E608/E608M, E1159, or 1223, as appropriate, for guidance in these areas. E2181/E2181M for guidance in these areas.

1.10 The temperature-emf data in this specification are intended for industrial and laboratory use.

¹ These tables are under the jurisdiction of ASTM Committee E20 on Temperature Measurement and are the direct responsibility of Subcommittee E20.04 on Thermocouples.

Current edition approved Sept. 23, 2003. Published September 2003. Originally approved in 1963. Last previous edition approved in 2002 as E230-02. DOI: 10.1520/E0230-03.

Current edition approved May 15, 2011. Published August 2011. Originally approved in 1963. Last previous edition approved in 2003 as E230-03. DOI: 10.1520/E0230_E0230M-11.

² These temperature-emf relationships have been revised as required by the international adoption in 1989 of a revised International Temperature Scale (ITS-90).

() E230/E230M – 11

1.11 Thermocouple color codes per IEC 584-3 are given in Appendix X1.

<u>1.12</u> The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

<u>1.13 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.</u>

3. Source of Data

3.1 The data in these tables are based upon the SI volt⁵ and the International Temperature Scale of 1990 (ITS-90).

3.2 The temperature-emf data in Tables 8– to 23 and 26–45, 26 to 45, together with the corresponding equations in Tables 7 and 46 for all of the thermocouple types, types except type Type C, have been extracted from NIST Monograph 175. Temperature-emf data in Tables24–25 Tables 24 and 25 and the coefficients for type Type C in Tables 7 and 46 have been developed from curves fitted to wire manufacturers² data.

Note 1—It is beyond the scope of this standard to discuss the origin of these tables, but if tables. If further information is desired, required, the reader should consult the NIST reference noted above. Monograph 175.

3.3 These tables give emf values to three decimal places $(1 \ \mu V)$ at temperature intervals of one degree. Such The tables are satisfactory for most industrial uses but may not be adequate for computer and similar applications. If greater precision is required, the reader should refer to the NIST reference noted above Monograph 175 which includes tables giving emf values to four decimal places $(0.1 \ \mu V)$ for each type except type Type C. Equations which permit easy and unique generation of the temperature-emf relationships willcan be found in Table 7. For convenience, coefficients of inverse polynomials that may be used to eompute approximate temperature (°C) as a function of thermocouple emf are given in Table 46.

4. Thermocouple Types and Letter Designations

4.1 The letter symbols identifying each reference table are those which are in common use throughout industry and identify the following thermocouple calibrations:

4.1.1 Type B—Platinum-30 % rhodium (+) versus platinum-6 % rhodium (-).

4.1.2 Type E-Nickel-10 % chromium (+) versus copper-45 % nickel (constantan) (-).

4.1.3 Type J-Iron (+) versus copper-45 % nickel (constantan) (-).

4.1.4 *Type K*—Nickel-10% chromium (+) versus nickel-5% (aluminum, silicon) (-) (Note 2). __Nickel-10 % chromium (+) versus nickel-5 % (aluminum, silicon) (-).

NOTE 2-Silicon, or aluminum and silicon, may be present in combination with other elements.

4.1.5 *Type N*—Nickel-14% chromium, $1\frac{1}{2}$ % silicon (+) versus nickel- $4\frac{1}{2}$ % silicon- $\frac{1}{10}$ % magnesium (-). ____Nickel-14% chromium, 1.5% silicon (+) versus nickel-4.5% silicon-0.1% magnesium (-).

4.1.6 Type R—Platinum-13 % rhodium (+) versus platinum (-).

4.1.7 Type S—Platinum-10 % rhodium (+) versus platinum (-).

³ For referenced ASTM standards, visit the ASTM website, www.astm.org, or contact ASTM Customer Service at service@astm.org. For *Annual Book of ASTM Standards* volume information, refer to the standard's Document Summary page on the ASTM website.

⁴ Available from National Institute of Standards and Technology (NIST), 100 Bureau Dr., Stop 1070, Gaithersburg, MD 20899.

⁵ Discussed in NIST Technical Note 1263, Guidelines for Implementing the New Representations of the Volt and Ohm Effective January 1, 1990.

4.1.8 Type T—Copper (+) versus copper-45 % nickel (constantan) (-).

4.1.9 Type C—Tungsten-5 % Rhenium (+) versus Tungsten-26 % Rhenium (-).

4.2 Each letter designation of <u>in</u> 4.1 identifies a specific temperature-emf relationship (<u>Tables8–23)</u>(<u>Tables 8 to 25</u>) and may be applied to any thermocouple conforming thereto within stated tolerances on initial values of emf versus temperature, regardless of its composition.

4.3 The thermoelement identifying symbols in Tables 26 to 45 use the suffix letters P and N to denote, respectively, the positive and negative thermoelement of a given thermocouple type.

4.4 Tables 26 to 45 identify specific temperature-emf relationships of individual thermoelements with respect to platinum (NIST Pt-67). Although tolerances on initial values of emf versus temperature, in most cases, are not established for individual thermoelements with respect to platinum, the <u>The</u> appropriate letter designation may be applied to any thermoelement which, when combined with its mating thermoelement, will form a thermocouple conforming to the corresponding table within the stated tolerances.

4.5 An overall suffix letter "X" (for example KX, TX, EPX, JNX) denotes an "extension grade" material whose thermoelectric properties will match those of the corresponding thermocouple type within the stated extension grade tolerances over a limited temperature span.range. Most base metal extension wires have the same nominal composition as the thermocouple wires with which they are intended to be used, whereas the *compensating* extension wires for noble metal or refractory metal thermocouple types (S, R, B, or C) are usually of a different, more economical composition whose relative thermoelectric properties as a pair nonetheless closely approximate those of the noble metal or refractory metal thermocouples with which they are to be used <u>over a limited temperature range</u>.

5. Tolerances on Initial Values of <u>EMIFEmf</u> versus Temperature

5.1 <u>FIn the United States, thermocouples and matched thermocouple wire pairs are normally supplied conforming to the tolerances on initial values of emf versus temperature listed provided in Table 1.</u>

5.1.1 Tolerances on initial values of emf versus temperature for single-leg thermoelements referenced to platinum have been established only for Types KP and KN. These are supplied, by common practice, to a tolerance equivalent to one half the millivolt tolerance of the Type K thermocouple.

5.1.2 For all other thermocouple types, tolerances on initial values of emf versus temperature for single thermoelements, when required, thermoelements should be established by agreement between the consumer purchaser and the producer.supplier.

5.1.3 In reference-Tables 34, 35, 44, and 45, the thermoelements are identified by two thermoelement symbols indicating their applicability to two thermocouple types. This indicates that the temperature-electromotive force relationship of the table is typical of the referenced thermoelements over the temperature range given in Table 1 for the corresponding thermocouple type. It should not be assumed, however, that thermoelements used with one thermocouple type are interchangeable with those of the other, or that they have the same millivolt tolerances for the initial values of emf versus temperature.

5.2 Thermocouple extension wires and compensating extension wires are supplied to <u>conform to</u> the tolerances on initial values of amf varius temperature shown in Tables 2.3

of emf versus temperature shown in Tables2-3. st/8/824548-beeb-483f-80bb-2a658980910c/astm-e230-e230m-11 5.2.1The initial Tables 2 and 3, respectively.

<u>5.2.1 Initial</u> tolerances of extension grade materials and compensating extension materials apply over a more limited spanrange of temperature than the corresponding thermocouple grade materials. Applicable temperature ranges, consistent with typical usage, are given in Tables 2– and 3.

6. Color Coding

6.1 Color codes for insulation on thermocouple grade materials, along with corresponding thermocouple and thermoelement letter designations, are given in Table 4.

6.2 Extension wires for thermocouples are distinguished by having an identifying color in the outer jacket as shown in Table 5, where letter designations for the extension thermoelements and pairs are also presented.

6.3Information in Tables4-5 is based on customary United States practice.

6.3 Information presented in Tables 4 and 5 is based on customary practice in the United States.

Note 3—Other insulation color coding conventions may be found in use elsewhere in the world. Refer to Appendix X1 for information.

APPENDIX

(Nonmandatory Information)

X1. IEC COLOR CODE SYSTEM

X1.1 General

X1.1.1The data presented in Tables4–5 of this specification show the color coding required by this specification. Those colors are well established in the United States and have been in use as the national standard there for many years.

X1.1.2In other parts of the world, there are alternative color code systems, either now in use, or in process of being implemented. X1.1.3One such color code system is that established by the IEC. The IEC color code system is outlined here for reference. Table X1.1 shows the IEC standard colors for thermocouple cables, extension cables, and compensating cables.

X1.1.1 The data in Tables 4 and 5 show the color coding required by this specification.

<u>X1.1.2</u> In other parts of the world, there are alternative color code systems in use. An alternative color code system which has been widely accepted outside of the United States is that established by the International Electrotechnical Commission (IEC). For reference, Table X1.1 shows the IEC standard colors for thermocouple cables, extension cables, and compensating cables.

TABLE 1 Tolerances on Initial Values of Emf vs. Temperature for Thermocouples

Note 1—Tolerances in this table apply to new essentially homogeneous thermocouple wire, normally in the size range 0.25 to 3 mm in diameter (No. 30 to No. 8 Awg)<u>AWG</u>) and used at temperatures not exceeding the recommended limits of Table 6. If used at higher temperatures these tolerances may not apply.

NOTE 2—At a given temperature that is expressed in °C, the tolerance expressed in °F is 1.8 times larger than the tolerance expressed in °C. Note that wherever applicable, percentage-based tolerances must be computed from temperatures that are expressed in °C. 2—At a given temperature that is expressed in °C, the tolerance expressed in °F is 1.8 times larger than the tolerance expressed in °C. Where tolerances are given in percent, the percentage applies to the temperature being measured when expressed in degrees Celsius. To determine the tolerance in degrees Fahrenheit, multiply the tolerance in degrees Celsius by 9/5.

NOTE 3—Caution: Users should be aware that certain characteristics of thermocouple materials, including the emf_versus_temperature relationship may change with time in use; consequently, test results and performance obtained at the time of manufacture may not necessarily apply throughout an extended period of use. Tolerances given in this table apply only to new wire as delivered to the user and do not allow for changes in characteristics with use. The magnitude of such changes will depend on such factors as wire size, temperature, time of exposure, and environment. It should be further noted that due to possible changes in homogeneity, attempting to recalibrate used thermocouples is likely to yield irrelevant results, and is not recommended. However, it may be appropriate to compare used thermocouples *in-situ* with new or known good ones to ascertain their suitability for further service under the conditions of the comparison.

KA	-200 to 0	-328 to 32	±2.2 or ±2 %		B	

*The standard tolerances shown do not apply to Type E mineral-insulated, metal-sheathed (MIMS) thermocouples and thermocouple cables as described in Specifications E608/E608M and E585/E585M. The standard tolerances for MIMS Type E constructions are the greater of $\pm 2.2^{\circ}$ C or ± 0.75 % from 0 to 870°C and the greater of $\pm 2.2^{\circ}$ C or ± 2 % from -200 to 0°C.

^A Thermocouples and thermocouple materials are normally supplied to meet the tolerances specified in the table for temperatures above 0°C. The same materials,

however, may not fall within the tolerances given for temperatures below 0°C in the second section of the table. If materials are required to meet the tolerances stated for temperatures below 0°C the purchase order must hall so state. Selection of materials usually will be required.

^B Special tolerances for temperatures below 0°C are difficult to justify due to limited available information. However, the following values for Types E and T thermocouples are suggested as a guide for discussion between the purchaser and supplier:

Type E-200 to 0 °C \pm 1 °C or \pm 0.5% (whichever is greater) Type T-200 to 0 °C \pm 0.5 °C or \pm 0.8% (whichever is greater) Type E, - 200 to 0 °C, \pm 1.0°C or \pm 0.5% (whichever is greater) Type E, - 200 to 0 °C, \pm 1.0°C or \pm 0.5% (whichever is greater) Type E, - 200 to 0 °C, \pm 1.0°C or \pm 0.5% (whichever is greater)

Type T, – 200 to 0°C, \pm 0.5°C or \pm 0.8 % (whichever is greater)

Initial values of tolerance for Type J thermocouples at temperatures below 0°C and special tolerances for Type K thermocouples below 0°C are not given due to the characteristics of the materials. Data for type N thermocouples below 0°C are not currently available.

TABLE 2 Tolerances on Initial Values of Emf vs. Temperature for Extension Wires

Note 1—Tolerances in this table represent the maximum error contribution allowable from new and essentially homogeneous thermocouple extension wire when exposed to the full temperature range given in the table below. Extension grade materials are not intended for use outside the temperature range shown.

NOTE 2—Thermocouple extension wire makes a contribution to the total thermoelectric signal that is dependent upon the temperature difference between the extreme ends of the extension wire length. The actual magnitude of any error introduced into a measuring circuit by homogeneous and correctly connected extension wires is equal to the algebraic difference of the deviations at its two end temperatures, as determined for that extension wire pair.

			Tolerances—Reference Junction 0°C (32°F)-[32°F]			
Thermocouple	Temperatu	re Range	Standard	Tolerances	Special T	olerances

TABLE 3 Tolerances on Initial Values of Emf vs. Temperature for Compensating Extension Wires

Note 1—Tolerances in this table apply to new and essentially homogeneous thermocouple compensating extension wire when used at temperatures within the range given in the table below.

NOTE 2—Thermocouple compensating extension wire makes a contribution to the total thermoelectric signal that is dependent upon the temperature difference between the extreme ends of the compensating extension wire length.

			Toleranc	es—Reference Junction 0°C (32°F) [32°F]

^A Special tolerance grade compensating extension wires are not available.

^B Proprietary alloy compensating extension wire is available for use over a wide temperature range.

^C Special compensating extension wires are not necessary with Type B over the limited temperature range 0 to 50 °C (32 50 °C [32 to 125 °F), 122 °F], where the use of non-compensated (copper/copper) conductors introduces no significant error. For a somewhat larger temperature gradient of 0 to 100 °C (32 100 °C [32 to 210 °F) 212 °F]

across the extension portion of the circuit, the use of non-compensated (copper/copper) extension wires may result in small errors, the magnitude of which will not exceed the tolerance values tolerances given in the table above for measurements above 1000 °C (1800 °F). 1000°C [1800°F].

TABLE 4 United States Color Codes for Single and Duplex Insulated Thermocouple Wire

NOTE 1—Data in this table represents customary practice in the United States of America. Different color code conventions may be found in use in other parts of the world.

NOTE 2—For some types of insulations, colors may appear as a stripe or trace strand. High temperature braided insulation is not insulations are normally supplied without color coded.coding.

NOTE 3—The noble metal thermocouples are not normally supplied with colored insulations. However, if they were so furnished, the color codes for the corresponding single wire extensions would apply, with a brown overall jacket, where applicable.

TABLE 6 Suggested Upper Temperature Limits for Protected Thermocouples

NOTE 1—This table <u>givesprovides</u> the recommended upper temperature limits for the various thermocouple <u>types</u> and wire sizes. These limits apply to protected thermocouples, that is, thermocouples in conventional closed-end protecting tubes. They do not apply to sheathed thermocouples having eompacted mineral oxide insulation. compacted, mineral-insulated, metal-sheathed thermocouples.

NOTE 2—The temperature limits given here are intended only as a guide to the user and <u>they</u> should not be taken as absolute values nor as guarantees of satisfactory <u>service</u> life or performance. These types and sizes are <u>sometimes</u> be used at temperatures above the <u>givenstated</u> limits, but usually at the expense of stability or <u>service</u> life or both. In <u>othersome</u> instances, it may be necessary to reduce the <u>abovetemperature</u> limits in order to achieve adequatesatisfactory performance in service. ASTM $MNL-12^A$ and other literature sources should be consulted for additional applications information.

^A Manual on the Use of Thermocouples in Temperature Measurement, ASTM MNL-12, 1993.

^B Type C thermoelements cannot operate are not suitable for use in the presence of oxygen; therefore, protection for these thermocouples must provide an inert or non-oxidizing environment.

^C No. 24 GageAWG thermoelements are common for this thermocouple type, but other sizes are possible available and, with adequate protection, are generally useable over the same temperature range.

TABLE 7 Polynomial Coefficients for Generating Thermocouple EMFEmf as a Function of Temperature

Note 1—The following table contains sets of polynomial coefficients used to compute emfs for the various types of thermocouples and for their individual thermoelements paired with Pt-67, when reference junctions are at $\underline{0}^{\circ}$ C.

NOTE 2—The coefficients given are for an expression of the form: $E = c_0 + c_1t + c_2t^2 + c_3t^3 + ... + c_nt^n$. In this expression, E is in millivolts, t is in °C, and $c_0, c_1, c_2 + ... + c_n$ are the coefficients given in the following table. For the Type K thermocouple and the Type KN thermoelement, coefficients b_0 and b_1 for an exponential term containing *e*, the natural logarithm base, also appear in the table. This term is of the form: $b_0e^{b_1(t-126.9680)^2}$ and, where given, it is to be evaluated and added to the polynomial result.

NOTE 3—If emf values on another temperature scale are desired, first convert the desired temperature to its equivalent in °C, then evaluate the appropriate polynomial from the table below using the °C equivalent temperature.
