Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 14, *Shafts for machinery and accessories*.

This second edition cancels and replaces the first edition (ISO 4156-3:2005), which has been technically revised.

The main changes compared to the previous edition includes:

— ISO/R 1938-1 has been removed from Clause 2;

— ISO 268-1 and ISO 1328 (all parts) have been moved from Clause 2 to Bibliography;

— symbols of length and arc length between two points, according to ISO 80000-3, have been adopted and used in the formulae;

— in Figure 9, ball or pin contact diameter, internal spline has been added;

— in Figure 12, measurement *W*, indication of base pitch, circular base thickness, and base diameter have been corrected;

— Table 10 has been revised;

— in Figure 16, measurement of value A has been corrected;

— Formula (A.3) has been corrected;

— calculation results B_1 and E_r in A.3 have been corrected;

— in Figure A.2, the figure and subfigure titles have been corrected.

A list of all parts in the ISO 4156 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

ISO 4156 (all parts) provides the data and indications necessary for the design, manufacture and inspection of straight (non-helical) side-fitting cylindrical involute splines.

Straight cylindrical involute splines manufactured in accordance with ISO 4156 (all parts) are used for clearance, sliding and interference connections of shafts and hubs. They contain all the necessary characteristics for the assembly, transmission of torque, and economic production.

The nominal pressure angles are 30°, 37,5° and 45°. For electronic data processing purposes, the form of expression 37,5° has been adopted instead of 37°30'. ISO 4156 (all parts) establishes a specification based on the following modules:

— for pressure angles of 30° and 37,5° the module increments are:

0,5; 0,75; 1; 1,25; 1,5; 1,75; 2; 2,5; 3; 4; 5; 6; 8; 10;

— for pressure angle of 45° the module increments are:

0,25; 0,5; 0,75; 1; 1,25; 1,5; 1,75; 2; 2,5.

Straight cylindrical involute splines — Metric module, side fit —

Part 3: Inspection

1 Scope

This document provides data, guidance and requirements for the inspection of straight (non-helical) side fitting cylindrical involute splines.

Limiting dimensions, tolerances, manufacturing deviations and their effects on the fit between connecting coaxial spline elements are defined and tabulated. Linear dimensions are expressed in millimetres and angular dimensions in degrees.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 3, *Preferred numbers — Series of preferred numbers*

ISO 1101, *Geometrical product specifications (GPS) — Geometrical tolerancing — Tolerances of form, orientation, location and run-out*

ISO 1938-1, *Geometrical product specifications (GPS) — Dimensional measuring equipment — Part 1: Plain limit gauges of linear size*

ISO 4156-1, *Straight cylindrical involute splines — Metric module, side fit — Part 1: Generalities*

ISO 4156-2, *Straight cylindrical involute splines — Metric module, side fit — Part 2: Dimensions*

ISO 5459, *Geometrical product specifications (GPS) — Geometrical tolerancing — Datums and datum systems*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 4156-1 apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at http://www.electropedia.org/

4 Symbols and abbreviated terms

NOTE Some of the symbols used can have a meaning other than the one intended here. The symbols H, Z, Y and W are common for gauge tolerances in other ISO standards and can seem to conflict with symbols used in this document. However, it was not thought necessary to distinguish between them, since the context will always preclude any ambiguity.

$a_{allowed}$	Limited maximum value of distance out of the actual tolerance limit	µm
D	Pitch diameter	mm
D_b	Base diameter	mm
D_{ee}	Major diameter, external spline	mm
$D_{ee\,max}$	Maximum major diameter, external spline	mm
$D_{ee\,min}$	Minimum major diameter, external spline	mm
$D_{Fe\,max}$	Maximum form diameter, external spline	mm
$D_{Fi\,min}$	Minimum form diameter, internal spline	mm
D_{ii}	Minor diameter, internal spline	mm
$D_{ii\,min}$	Minimum minor diameter, internal spline	mm
D_{Re}	Diameter of measuring ball or pin for external spline	mm
D_{Ri}	Diameter of measuring ball or pin for internal spline	mm
d_{ce}	Ball or pin contact diameter, external spline	mm
d_{ci}	Ball or pin contact diameter, internal spline	mm
E	Basic space width, circular	mm
E_{max}	Maximum actual space width	mm
E_{min}	Minimum actual space width	mm
E_r	Eccentric radial offset	mm
E_v	Effective space width, circular	mm
$E_{v\,max}$	Maximum effective space width	mm
$E_{v\,min}$	Minimum effective space width	mm
F_p	Total pitch deviation	µm
F_α	Total profile deviation	µm
F_β	Total helix deviation	µm
i	Integer defining the tooth considered and has values 0, 1, 2, …, z-1 (as used in Annex A)	—
inv α	Involute $\alpha\left(=\tan\alpha-\pi\cdot\alpha/180°\right)$	—
K_e	Approximation factor for external spline	—
K_i	Approximation factor for internal spline	—
k	Number of measured teeth	—
L_{STA}	Statistical tolerance limit actual	µm, %

$L_{\text{STA absolute}}$	Statistical tolerance limit actual absolute	µm, %
$L_{\text{STA relative}}$	Statistical tolerance limit actual relative	%
l_{BA}	Length between two points (e.g. point B and point A)	mm
M_{Re}	Measurement over two balls or pins, external splines	mm
M_{Ri}	Measurement between two balls or pins, internal	mm
m	Module	mm
n_{allowed}	Maximum allowed number of measured sizes outside tolerance limit	—
p_{b}	Base pitch	mm
S	Basic tooth thickness, circular	mm
S_{max}	Maximum actual tooth thickness	mm
S_{min}	Minimum actual tooth thickness	mm
S_{b}	Circular base thickness	mm
$S_{\text{v max}}$	Maximum effective tooth thickness	mm
$S_{\text{v min}}$	Minimum effective tooth thickness	mm
s_{DE}	Arc length between two points (e.g. point D and point E)	mm
T	Machining tolerance	µm
T_{v}	Effective clearance tolerance	µm
W	Measurement over k teeth, external spline	mm
z	Number of teeth	—
α	Pressure angle	°
α_{ce}	Pressure angle at ball or pin diameter, external spline	°
α_{ci}	Pressure angle at ball or pin diameter, internal spline	°
α_D	Standard pressure angle at pitch diameter	°
α_{e}	Pressure angle at ball or pin centre, external spline	°
α_{i}	Pressure angle at ball or pin centre, internal spline	°
Δ_{safety}	Safety recommendation value	mm
λ	Deviation allowance	µm
τ	Angular pitch	°
ψ	Phase angle	°

5 Reference conditions

The standard reference temperature for industrial length measurements is 20 °C. The dimensional requirements for parts and gauges are defined at that temperature and inspection shall also normally be carried out at that same temperature.

If measurements are taken at another temperature, the results shall be corrected using the expansion coefficients of parts and gauges respectively.

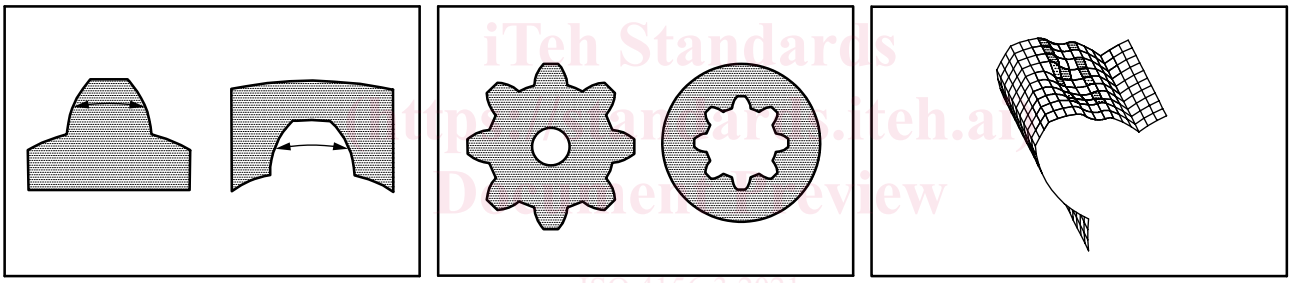
Unless otherwise specified, all measurements shall be made under zero measuring load.

If measurements are made under a non-zero load, the results shall be corrected accordingly. However, such correction is not required for comparison measurements made with the same comparison means and under the same measuring load, between similar components of the same material and with the same surface condition.

6 Quality features

6.1 General

The inspection of splines is divided into three quality features, as shown in Figure 1. To specify the location ISO 1101 and ISO 5459 shall be used. For form and size ISO 4156-1 and ISO 4156-2 apply.



a) Size **b) Location** **c) Form**

NOTE 1 Size can be a quality feature (actual, effective).

NOTE 2 Location can be a quality feature (runout, coaxiality, perpendicularity).

NOTE 3 Form can be a quality feature (profile, helix, pitch).

Figure 1 — Quality features

6.2 Size

6.2.1 Actual size

The actual size is

a) for external splines, the circular tooth thickness at the pitch diameter, and

b) for internal splines, the circular space width at the pitch diameter.

6.2.2 Effective size

The effective tooth thickness or space width is the maximum material condition resulting from the actual size and the accumulation of form deviations.

6.3 Location

The location of a spline is the location of the central axis in relation to any other geometrical element found by actual or effective inspection methods.

6.4 Form

The form deviations of a spline are the deviations to the true geometrical form of profile, helix and pitch.

7 Methods of inspection

7.1 Size

7.1.1 General methods

Three general methods of inspection are provided in Table 1. If not otherwise specified, the standard method shall be used. If the alternative methods A or B are required, this shall be stated in the part data table. For the consequence of general methods, see Table 2.

Table 1 — Relationship between parameters and control method

	Minimum material	Minimum effective clearance	Maximum effective clearance
Parameter	S_{min}/E_{max}	$S_{v\,max}/E_{v\,min}$	$S_{v\,min}/E_{v\,max}$
Standard method	X	X	—
Method A	X	X	X
Method B	—	X	X

Table 2 — Consequence of general methods

Inspection method	Theoretical maximum clearance between mating parts (zero form deviation)	Maximum deviation of form in each part (zero clearance)
Standard	$2\,(T + \lambda)$	$T + \lambda$
Alternative A	$2T_v$	$T + \lambda$
Alternative B	$2T_v$	Undetermined
NOTE The theoretical maximum clearance between mating parts in this table is for parts in their new condition. The clearance increases when wear occurs.		

7.1.2 Choice of measuring instrument

The choice of measuring instrument shall be made according to the design requirements (see ISO 4156-1). See Table 3 and Figure 2.

7.1.3 Actual size

7.1.3.1 Dimensions over and between balls

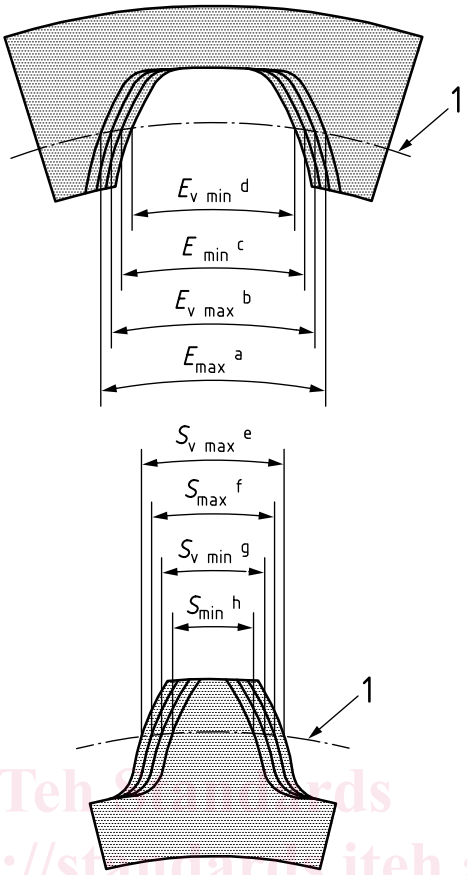
The dimension over or between balls facilitates the calculation of the theoretical actual circular tooth thickness or space width at the pitch circle diameter based on the actual tooth thickness or space width where the balls contact through one normal plane. The size measured over or between balls is a true size at 2 particular gaps and in one particular plane.

7.1.3.2 Dimensions over and between pins

The dimension over or between pins facilitates the calculation of the theoretical actual circular tooth thickness or space width at the pitch circle diameter based on the actual tooth thickness or space width where the pins have a line contact.

Table 3 — Size Inspection measuring instruments, methods and priorities

Priority	Parameter			
	S_{min}/E_{max}	$S_{v\,max}/E_{v\,min}$	$S_{v\,min}/E_{v\,max}$	S_{max}/E_{min}
	Method			
Highest	Measurement over and between balls	GO composite gauge	NO GO composite gauge	Measurement over and between balls
Lower ↓	Measurement over and between pins NO GO sector gauge Variable sector gauge Span size	Variable composite gauge Analysis calculations using size and form deviations	Variable composite gauge	Measurement over and between pins Variable sector gauge



Key

1 pitch circle

a NO GO sector plug gauge or maximum measurement between balls or pins.

b NO GO composite plug gauge.

c Minimum measurement between balls or pins, auxiliary.

d GO composite plug gauge.

e GO composite ring gauge.

f Maximum measurement over balls or pins, auxiliary.

g NO GO composite ring gauge.

h NO GO sector ring gauge or minimum measurement over balls or pins.

Figure 2 — Elementary inspection methods for space widths and tooth thicknesses

7.1.3.3 NO GO sector gauge

The NO GO sector gauge is used to inspect the specified actual tolerance limit of the circular tooth thickness or space width at the minimum material condition of the part, where the gauge contacts only at the ends.

7.1.3.4 Span size over *k* teeth

The span measurement facilitates the calculation of the theoretical actual circular tooth thickness of external splines at the pitch circle diameter based on the measurement over a block of teeth. Before using this method, suitability should be checked.

7.1.3.5 Variable sector gauge

The variable sector gauge measures the actual circular tooth thickness or space width. The actual measurement is achieved using radially locking left- and right-hand flanks and comparison to a master having a known tooth thickness or space width.

7.1.4 Effective size

7.1.4.1 GO composite gauge

GO composite gauges are used to check

a) that the specified effective limits of tooth thickness or space width are not exceeded at the maximum material condition of the part,

b) the specified form diameter of the part, thus ensuring that the required tolerances are controlled for the full involute depth, and

c) the specified length of engagement, thus ensuring that the spline maximum material limit has not been exceeded.

7.1.4.2 Variable composite gauge

The variable composite gauge measures the effective size of tooth thickness or space width. The actual measurement is achieved using the radially locking left- and right-hand flanks and comparison to a master having a known tooth thickness or space width.

7.1.4.3 NO GO composite gauge

The NO GO composite gauge is used to check the specified effective limit of minimum tooth thickness or maximum space width, where the gauge contacts only at the ends.

7.1.4.4 Inspection of diameter at tooth tip (D_{ii} or D_{ee})

All these inspection methods require measuring the tooth tip (internal minor diameter, D_{ii}, or external major diameter, D_{ee}) using GO and NO GO plain (plug or ring) gauges or other acceptable measuring devices.

7.2 Location

7.2.1 General

Splines have an actual and effective true size of space width or tooth thickness, and hence also an actual and effective axis.

The tolerances concerning location (i.e. runout, total runout, concentricity, and coaxiality tolerances) shall be specified on the component drawing. Where the spline is used as a datum axis, other geometry features shall be toleranced to the spline axis. Because of the inherent form deviations, difficulties arise in the reproducibility and repeatability of the spline profile if the form deviations and cylindricity deviations are numerous.

7.2.2 Choice of the method of inspection of location

The methods of inspection of location are given in Table 4.
