Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO ~~documents~~document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see ~~www.iso.org/directives~~www.iso.org/directives).

~~Attention is drawn~~ISO draws attention to the possibility that ~~some of~~ the ~~elements~~implementation of this document may ~~be~~involve the ~~subject~~use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights~~.~~ in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.~~ Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).~~

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see ~~www.iso.org/iso/foreword.html~~www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 204, *Intelligent* ~~Transport Systems,~~ *transport systems.*

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at ~~www.iso.org/members.html~~www.iso.org/members.html.

Introduction

In previous years, the development of intelligent transport system (ITS) standards has been focussed on road vehicles and supporting traffic and transport systems. Although provisions in respect of accessibility and accommodation of all travellers, including people with disabilities and older adults, have been taken into consideration, related requirements for ITS have not been accommodated, primarily because of the lack of ~~the~~ possibility ~~to communicate~~for communicating electronically with these travellers.

The more recent focus on Mobility as a Service (MaaS), cooperative, connected and automated mobility (CCAM), and multimodal end-to-end journey planning and management, incorporate travel means such as active modes (e.g. bicycles) and micromobility vehicles (MMV) such as powered bicycles, powered scooters, Segways, powered boards, etc. Often, they also involve device sharing. End-to-end multimodal journeys often also include part of the journey on foot.

ITS service provision has, to date, tended to agglomerate standards for “road users”, “drivers”, “vehicles” and is largely focused on car drivers and the systems that control or assist them. Some attention has also been focused on public service and commercial vehicles. But another group of light vehicle mode users are ~~Powered Two Wheeled Vehicle~~powered two-wheeled vehicle (P2WV) riders. With a few exceptions, there has been little appreciation of the different characteristics and behaviour of motorcycles, mopeds, trikes and quads and requirements that they have that differ from those for other categories.

These categories of conveyances and travellers, at the least, have needs to be communicated regarding ITS service provision. Conversely, many ITS services often need to communicate with, or be aware of the presence of, these actors. Yet, in previous years, there have generally not been any means ~~to communicate~~for communicating with them individually.

However, during the last few years, smartphones~~,~~ and other nomadic devices have not only become available, but are already indispensable for multimodal journeys and assist in ITS service provision. Smartphone technology is also often used in devices assisting. The advent of low-cost communications and cooperative technologies can also assist in the provision of services.

Intelligent ~~transportation~~transport systems — Mobility ~~Integration – Gap analysis of standardization of C-ITS~~integration — Mobility integration needs for vulnerable users and light ~~mode conveyances and accessibility~~modes of transport

1 Scope

This document provides a review of mobility integration standardization efforts supporting all travellers using active and light transport modes and identifies gaps where additional standardization is potentially required. The gap analysis is focussed on cooperative intelligent transportation systems (C-ITS) for all users, including people with disabilities, as they plan, manage and carry out their "complete trip", including all connections and transfers, from end-to-end.

The term "light mode conveyances" covers C-ITS for light power and active modes such as micromobililty vehicles (e.g. e-scooters), power or power-assisted vehicles (e.g. e-bikes, power wheelchairs), and full powered vehicles (e.g. motorcycles, mopeds).

This document identifies areas where standardization is potentially required to ~~solve~~resolve problems and challenges, or to create opportunities, particularly with respect to ~~enhanced~~enhancing safety and the provision of end-to-end multimodal journeys and support.

~~5 VRU~~

4 ~~VRU~~Vulnerable road users (VRUs)

~~5.1~~4.1 VRUs in standardization

This clause describes the current provisions and differences among regions and standardization organizations when defining VRUs, the eco-system in which VRUs exist, the devices used for detection, control and communication, information exchanged with other actors, and the haptic sensory approaches used for notification.

~~5.2~~4.2 ~~VRU~~VRUs in the ~~Context~~context of C-ITS

~~5.2.1~~4.2.1 Overview

C-ITS and connected vehicle (CV) ~~programs~~programmes typically characterize communications between vehicles (V2V), between vehicles and infrastructure (V2I) and between vehicles and pedestrians (V2P). “Pedestrians” in this context typically refers to VRUs including people walking, passengers embarking and disembarking buses and trains, animals, people in work zones, people riding bicycles and people riding low-powered mobility devices such as e-scooters, powered wheelchairs~~,~~ and power assisted bikes.

~~5.2.2~~4.2.2 C-ITS safety processes

Standards for VRUs are derived from the needs associated with their travel safety requirements. Typical C-ITS activities follow a process flow as shown in ~~Figure 1.~~ Figure 1. The flow begins when a vehicle, pedestrian or infrastructure detects the presence of a threat (1. Detection). Once detected, the system identifies the type of threat (2. Identification). In some cases, the path taken by the “threat” can be assumed by way of path restrictions (3. Compliance with right of way). Examples of right of way restrictions include a railroad grade crossing with gates drawn, a bicycle blocking a walkway, or pedestrians crossing against a traffic signal. For any actor to take evasive action or be notified of the threat, the threat's expected manoeuvre needs to be determined (4. Expected ~~Manoeuvre).~~ manoeuvre). Finally, the appropriate action can be taken to inform or alert the actor of the threat (5~~-~~. Communicate). These processes apply to V2V, V2I and V2P processes, albeit via different ITS ~~Station~~ S devices and applications.

Formatted: Font: 11 pt

Formatted: Font: Not Bold

Formatted: Font: 11 pt

Formatted: Space After: 0 pt, Line spacing: single

1) ~~1)~~ **Detection** — This process requires technologies to identify objects that are nearby. There are many such detection methods currently in use, including passive sensors that detect the presence of VRUs (e.g.~~,~~. lidar, ~~Bluetooth~~wireless, and acoustic) or active communications between ITS-S devices (V2x or more appropriately VRU-2-x).

2) ~~2)~~ **Identification** — This process requires understanding the characteristics of the “threats”. In this case, the process focuses on identifying the type of VRU. To aid in subsequent processes, such as determining compliance with rules and expected behaviours, the VRU characteristics are required to assess compliance and predict behaviour~~; these~~. These parameters include understanding maximum speed, dimensions, behavioural profile, restrictions and more. A VRU type and model will provide the appropriate information to feed these subsequent processes. ~~See 5.1~~See 5.1 for existing definitions and taxonomies that detail classification models for VRUs.

3) ~~3)~~ **Compliance with right of way** (RoW) — This process involves determining compliance with RoW restrictions. In some cases, this rule is targeted to the VRU, for example, no walk signals for people with a visual impairment. Compliance with RoW requires vehicles and VRUs to follow transport rules. For example, the infrastructure can detect a cyclist ~~traveling~~travelling on a restricted highway, an e-scooter parked in a pedestrian path impacting a person with visual disability, or a vehicle making a right turn onto a restricted road.

4) ~~4)~~ **Expected manoeuvres** — This process describes algorithms and models of VRU behaviour. These models provide scenarios which demonstrate, for example, the different expectations of intersection crossing by an adult walking with a young child versus a runner. Specific standards in this area are too new to determine. Research in “near miss collisions” particularly between VRUs (e.g.~~,~~. bikes/e-scooters and pedestrians) as well as predicting VRU behaviour (in groups as well as by individuals) using predictive analytics, machine learning and other artificial intelligence techniques will help identify information needed to support the emerging tools.

5) ~~5)~~ **Communicate** — This process describes the processes for alerting the ITS-S application associated with the appropriate threatened actor. For the VRU for example, this alert can be received and delivered by infrastructure (flashing sign), VRU vehicle (bicycle, scooter, motorcycle), or by a personal nomadic device~~-~~.

Research, technologies~~,~~ and use case descriptions generally fall into these five categories. ETSI use cases describe additional complexities that augment our understanding (see ~~references [1], [2] and [3])~~References [1], [2] and [3]).

~~5.2.3~~4.2.3 C-ITS view of VRU

Many standards related to VRUs deal with ~~vehicle~~vehicles or infrastructure sensing and avoiding the VRU. However, with new research~~,~~ and reduced costs of awareness sensors, an increasing number of VRUs are likely to possess personal devices with ITS-S applications. This document focuses on identifying the needs of the VRU including ~~on integrating them~~their integration into the C-ITS environment as an active rather than a passive participant.

At an early stage in the US Department of ~~Transportation~~Transportation's “Vehicle to Pedestrian” program, the focus was on detection and communication. Three “technology categories” were used that included pedestrians (i.e~~,~~. VRUs) as an active participant in the C-ITS environment~~. These included the following categories~~:

1) **Unilateral ~~Pedestrian Detection~~pedestrian detection and ~~Driver Notification~~driver notification**: Technologies that provide collision alerts only to the driver~~-~~.

2) **Unilateral ~~Vehicle Detection~~vehicle detection and ~~Pedestrian Notification~~pedestrian notification**: Technologies that provide collision alerts only to the pedestrian ~~[~~(i.e~~,~~. VRUs~~]~~).

Formatted: Font: Not Bold
Formatted: Font: 11 pt
Formatted: Font: 11 pt
Formatted: Font: 11 pt
Formatted: Space After: 0 pt, Line spacing: single

3) **Bilateral Detectiondetection and Notification Systemsnotification systems:** Technologies that provide collision alerts to both drivers and pedestrians [(VRUs]) in parallel.

Research in this area is listed in a related technology scan sponsored by the US Department of Transportation. The categories are in fact much more complex than the three listed above. For example, the Unilateral Vehicle Detectionunilateral vehicle detection and Pedestrian Notificationpedestrian notification category can include:

a) Personala personal device detecting and notifying the VRU of collision;

b) Infrastructureinfrastructure detecting and notifying the VRU of collision (through audible or visual warnings)):

c) Infrastructureinfrastructure detecting and notifying VRUthe VRU's personal device of collision.

StandardsExisting standards have only addressed a limited subset of the needs identified. FurtherFurthermore, existing architectures (role—-based and physical) didhave not fully embraceembraced the categories or the complexities. In particular, the physical components, technologies and information flows vary for each of the three scenarios. To that end, the architecture needs to be technology and physical component agnostic. Even a VRU changes their role depending on travelingtravelling mode, and with them, the role of their personal ITS-S.

5.34.3 Definitions and Taxonomytaxonomy

5.3.14.3.1 Overview

The processes to detect and identify the VRU starts with understanding the type of VRU, and then determinesdetermining the behaviour of that VRU. Identification is determined by a clear set of logical categories that describe critical characteristics of the observed VRU. This clausesubclause describes various sets of taxonomies that relate to a VRU. These contribute to generating a comprehensive VRU Profileprofile that supports downstream processes. The areas include:

— Definitiondefinition and taxonomy for VRU (Clause 5.2.1)(5.2.1);

— Classificationclassification for VRU vehicles (VRV) and devices (Clause 5.2.2)(5.2.2);

— Combiningcombining VRU person and device/vehicle (Clause 5.2.3)(5.2.3).

5.3.24.3.2 Definition of VRU

5.3.2.14.3.2.1 General

There is no consensus on terminology, classifications or scope in terms of a VRU; the. The only profiles of VRU found in automotive standards are for pedestrian and bicycle.[21], [16].[21],[16]

However, certain additional definitions are listed in the sources covered in the following documents include definitions:subclauses.
