Stahlgussstücke für allgemeine Verwendung

This draft European Standard is submitted to CEN members for enquiry. It has been drawn up by the Technical Committee CEN/TC 190.

If this draft becomes a European Standard, CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration.

This draft European Standard was established by CEN in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and United Kingdom.

Recipients of this draft are invited to submit, with their comments, notification of any relevant patent rights of which they are aware and to provide supporting documentation.

Warning : This document is not a European Standard. It is distributed for review and comments. It is subject to change without notice and shall not be referred to as a European Standard.

European foreword

This document (prEN 12680-1:2023) has been prepared by Technical Committee CEN/TC 190 “Foundry technology”, the secretariat of which is held by DIN.

This document is currently submitted to the CEN Enquiry.

This document will supersede EN 12680-1:2003.

Within its programme of work, Technical Committee CEN/TC 190 requested CEN/TC 190/WG 10 “Testing for inner discontinuities” to prepare the following standard:

EN 12680-1, *Founding — Ultrasonic testing — Part 1: Steel castings for general purposes.*

This is one of three European Standards for ultrasonic testing. The other standards are:

EN 12680-2, *Founding — Ultrasonic testing — Part 2: Steel castings for highly stressed components.*

EN 12680-3, *Founding — Ultrasonic testing — Part 3: Spheroidal graphite cast iron castings.*

Annex A and Annex B are informative.

prEN 12680-1:2023 (E)

1 Scope

This document specifies the requirements for the ultrasonic testing of steel castings (with ferritic structure) for general purposes and the methods for determining internal discontinuities by the pulse-echo technique.

This document applies to the ultrasonic testing of steel castings which have usually received a grain refining heat treatment and which have wall thicknesses up to and including 600 mm.

For greater wall thicknesses, special agreements apply with respect to test procedure and recording levels.

This document does not apply to austenitic steels and joint welds.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document the terms and definitions given in EN ISO 5577 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp/>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1**equivalent reference discontinuity echo size**

indication to be recorded during the assessment phase of an ultrasonic test, usually expressed as an equivalent diameter of a flat-bottomed hole (FBH)

3.2**point-like discontinuity**

discontinuity, the dimensions of which are smaller than or equal to the sound-beam width

Note 1 to entry: Dimensions in this document relate to length, width and/or dimension in through-wall direction.

3.3**extended discontinuity**

discontinuity, the dimensions of which are larger than the sound-beam width

Note 1 to entry: Dimensions in this document relate to length, width and/or dimension in through-wall direction.

3.4**planar discontinuity**

discontinuity having two measurable dimensions

3.5**volumetric discontinuity**

discontinuity having three measurable dimensions

3.6**rim zone**

1/3 of the through-wall thickness from the surface with a maximum of 30 mm

3.7**special rim zone**

outer rim zone of the test object with special requirements

Note 1 to entry: Examples of special requirements are machined surfaces, higher stresses and sealing surfaces.

3.8**non-measurable dimension**

dimension of a discontinuity that is smaller than the beam width, which depends on the probe size and the frequency used. Current state of the industry is < 3 mm

3.9**production welding**

any welding carried out during manufacturing before final delivery to the purchaser

3.9.1**joint welding**

production welding used to assemble components together to obtain an integral unit

3.9.2**finishing welding**

production welding carried out in order to ensure the agreed quality of the casting

prEN 12680-1:2023 (E)

4 Requirements

4.1 Order information

The following information shall be available at the time of enquiry and order (see also EN ISO 16810):

- a) the areas of the casting and the number or percentage of castings to which the requirements of ultrasonic testing apply;
- b) the severity levels to be applied to the various zones or areas of the casting (acceptance criteria);
- c) requirements for a written test procedure;
- d) whether there are any additional requirements for the test procedure, see also 5.5.1.

4.2 Extent of testing

The casting shall be tested so that the agreed areas are covered (insofar as this is possible from the shape of the casting) by the use of the best applicable test technique.

For wall thicknesses greater than 600 mm, agreement shall be made between the manufacturer and the customer on the severity levels, test procedure and the recording of the test results.

4.3 Maximum acceptable size of discontinuities

4.3.1 General

Single discontinuities extending into the rim zone and core zone shall be evaluated as rim zone.

4.3.2 Acceptance levels for planar discontinuities mainly orientated perpendicular to the surface

The acceptance levels for planar discontinuities are given in Figure 1.

Discontinuities exceeding 3 mm FBH shall not be acceptable in severity level 1.

The largest dimension of a discontinuity in through-wall direction shall not exceed 10 % of the wall thickness, except discontinuities with a length ≤ 10 mm. Discontinuities with a length ≤ 10 mm shall not exceed a dimension in through-wall direction of 25 % of wall thickness or maximum 20 mm.

The greatest distance between discontinuities, as criterion for evaluation as single discontinuity or discontinuity area perpendicular or lateral to the surface, shall be 10 mm.

For a discontinuity with more than 3 mm in length and non-measurable dimension in the through-wall direction, this non-measurable dimension shall be taken as 3 mm and the area shall be calculated as follows:

$$A = 3 L \quad (1)$$

where

A is the area of discontinuity expressed in square millimetres;

3 is the width in millimetres;

L is the length in millimetres.

4.3.3 acceptance levels for volumetric discontinuities

The acceptance levels for volumetric discontinuities are given in Table 1. Any discontinuity exceeding one of the levels shall not be acceptable.

4.3.4 Maximum acceptable discontinuities when radiographic testing (RT) of the casting is carried out as a supplement to ultrasonic testing (UT)

Unless otherwise agreed by the time of enquiry and order, when conducting radiographic and ultrasonic testing in combination, it was proven that if a discontinuity indicated by radiographic testing is situated in the core zone, the discontinuity is acceptable at one level lower, e.g. severity level 3 instead of severity level 2 for radiographic testing. For further information, see EN 1559-2.

4.4 Qualification of personnel

Ultrasonic testing shall be performed by qualified personnel. Qualification of personnel can be in accordance with EN ISO 9712 or a certification scheme considered equivalent.

4.5 Wall section zones

The wall section shall be divided into core and rim zones as shown in Figure 2. These zones relate to the dimensions of the casting ready for assembly (finish-machined).

4.6 Severity levels

If the purchaser specifies different severity levels in different areas of the same casting, all of these areas shall be clearly identified and shall include:

- a) all necessary dimensions for accurate location of zones;
- b) the full extent of all weld preparations and the thickness of any special rim zone.

Severity level 1 is only applied to weld preparations and special rim zones.

Unless other requirements have been agreed at the time of acceptance of the order, for finishing welds, the requirements for the parent metal shall apply.

5 Testing

5.1 Principles

The principles of ultrasonic testing given in EN ISO 16810, EN ISO 16811 and EN ISO 16827 shall apply.

5.2 Material

The suitability of material for ultrasonic testing is assessed by comparison with the echo height of a reference reflector (usually the first back-wall echo) and the noise level. This assessment shall be carried out on selected casting areas which are representative of the surface finish and of the total thickness range of the objects to be tested. The assessment areas shall have parallel surfaces.

The reference echo height according to Table 2 shall be at least 6 dB above the noise level.

If the echo height of the smallest detectable flat-bottomed or equivalent side-drilled hole diameter at the far end of the test range to be assessed is less than 6 dB above the noise level, then ultrasonic testing has reduced performance. In this case, the diameter of the flat-bottomed or side-drilled hole which can be detected with a signal-to-noise ratio of at least 6 dB shall be noted in the test report, and the additional procedure shall be agreed between the manufacturer and the purchaser.

NOTE For the definition of an adequate diameter of a flat-bottomed hole, the distance-gain-size system (DGS) or a test block of identical material, heat treatment and thickness containing flat-bottomed holes with a diameter according to Table 2 or equivalent side-drilled holes, can be used. Formula (2) can be used for converting a flat-bottomed hole diameter into an equivalent side-drilled hole diameter:

prEN 12680-1:2023 (E)

$$D_Q = \frac{4,935 D_{FBH}^4}{\lambda^2 s} \quad (2)$$

where

- D_Q is the side-drilled hole diameter, in millimetres;
- D_{FBH} is the flat-bottomed hole diameter, in millimetres;
- λ is the wavelength, in millimetres;
- s is the path length, in millimetres.

The formula is applicable for $D_Q \geq 2 \lambda$ and $s \geq 5$ times the near-field length and is only defined for single-transducer probes.

5.3 Equipment and coupling medium**5.3.1 Ultrasonic instrument**

The ultrasonic instrument shall meet the requirements given in EN ISO 22232-1 and shall have the following characteristics:

- a) range setting capability, from at least 10 mm to 2 m, continuously selectable, for longitudinal and transverse waves in steel;
- b) gain span, adjustable in 2 dB maximum steps over a range of at least 80 dB with an accuracy of 1 dB;
- c) time-base and vertical linearities less than 5 % of the adjustment range of the screen;
- d) operating in combined transmitter-receiver mode or in separate transmitter-receiver-mode;
- e) suitability, at least for nominal frequencies from 1 MHz up to and including 5 MHz, for the pulse-echo technique with single-element and dual-element probes.

5.3.2 Probes

The probes shall meet the requirements given in EN ISO 22232-2 and EN ISO 22232-3 with the following exceptions:

- a) nominal frequencies shall be in the range 1 MHz to 5 MHz;
- b) for oblique incidence, angle-beam probes with angles between 35° and 70° shall be used.

NOTE Normal-beam or angle-beam probes can be used for the testing of steel castings. The suited type of probe depends on the geometry of the casting and the type of discontinuity to be detected.

For test zones close to the surface, dual-element probes (normal-beam or angle-beam) should be preferred.

5.3.3 Checking of the ultrasonic test equipment

The ultrasonic test equipment shall be checked regularly by the operator according to EN ISO 22232-3.

5.3.4 Coupling medium

A coupling medium in accordance with EN ISO 16810 shall be used. The coupling medium shall wet the test surface to ensure satisfactory sound transmission. The same coupling medium shall be used for the calibration and all subsequent test operations.

NOTE The sound transmission can be checked by one or more stable back-wall echoes in areas with parallel surfaces.

5.4 Preparation of casting surfaces for testing

For the preparation of casting surfaces for ultrasonic testing, see EN ISO 16810.

The casting surfaces to be tested shall be such that satisfactory coupling with the probe can be achieved.

With single-transducer probes, satisfactory coupling can be achieved if the condition of the surfaces to be used for testing corresponds at least to the limit comparator 4 S1 or 4 S2 according to EN 1370.

The roughness of any machined surface used for testing shall be $R_a \leq 12,5 \mu\text{m}$.

For special test techniques, higher surface qualities such as 2 S1, 2 S2 (see EN 1370) and $R_a \leq 6,3 \mu\text{m}$ can be necessary.

5.5 Test procedure

5.5.1 General

Because the choice of both the direction of incidence and suitable probes largely depends on the shape of the casting or on the possible discontinuities in the casting or on the possible discontinuities from finishing welding, the applicable test procedure shall be specified by the manufacturer of the casting.

If possible, the areas to be tested shall be tested from both sides. When testing from only one side, short-range resolving probes shall be used additionally for the detection of discontinuities close to the surface. Testing with dual-element probes is only adequate for wall thicknesses up to 50 mm.

Additionally, when not otherwise agreed between the purchaser and the manufacturer, for all castings, dual-element normal-beam and/or angle-beam probes shall be used to test the following areas up to a depth of 50 mm:

- a) critical areas, e.g. fillets, changes in cross-section, areas with external chills;
- b) finishing welds;
- c) weld preparation areas, as specified in the order;
- d) special rim zones, as specified in the order, critical for the performance of the casting.

Finishing welds which are deeper than 50 mm shall be subject to supplementary testing with other suitable angle-beam probes.

For angle-beam probes with angles over 60° , the sound path shall not exceed 150 mm.

Complete coverage of all areas specified for testing shall be performed by carrying out systematically overlapping scans.

The scanning speed shall not exceed 150 mm/s.

5.5.2 Range setting

Range setting on the ultrasonic instrument shall be carried out in accordance with EN ISO 16811, using normal-beam or angle-beam probes in accordance with one of the three options given below:
