This document is not an ASTM standard and is intended only to provide the user of an ASTM standard an indication of what changes have been made to the previous version. Because it may not be technically possible to adequately depict all changes accurately, ASTM recommends that users consult prior editions as appropriate. In all cases only the current version of the standard as published by ASTM is to be considered the official document.

Designation:F1852-08 Designation: F1852 - 11

# Standard Specification for "Twist Off" Type Tension Control Structural Bolt/Nut/Washer Assemblies, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength<sup>1</sup>

This standard is issued under the fixed designation F1852; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\varepsilon$ ) indicates an editorial change since the last revision or reapproval.

### 1. Scope\*

1.1 This specification covers two types of heat treated, steel, tension control bolt-nut-washer assemblies, also referred to as "sets." These assemblies are capable of developing a minimum predetermined tension when installed by applying torque to the nut, while at the same time applying a counter torque to separate the spline end from the body of the bolt using an appropriate spline drive installation tool.

1.2 An assembly consists of a tension control bolt with spline end (covered by this specification) and a suitable nut and washer covered by reference to applicable ASTM specifications.

1.3 The fastener assemblies are intended for use in structural connections. These connections, installation procedures, and the use of alternate design structural bolts are covered under the requirements of the "Specification for Structural Joints Using ASTM A325 or A490 Bolts," approved by the Research Council on Structural Connection.

1.4 The assemblies are available with either round (button or dome) heads, heavy hex structural heads, or alternate design heads described in Section 10 and Fig. 1, in sizes  $\frac{1}{2}$  to 1  $\frac{1}{8}$  in. inclusive, in two types specified in Section 4.

1.5 Terms used in this specification are defined in Terminology F1789 unless otherwise defined herein.

1.6 The values stated in inch-pound units are to be regarded as standard. No other units of measurement are included in this standard.

1.7 The following precautionary statement pertains only to the test method portions, Sections 13 and 14, of this Specification: *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

A These values are the same as the dimensions for Heavy Hex Structural Bolts specified in ANSI B18.2.1.

B The spline length (LS)and across the flat (S) dimensions are used for reference only. The grooved spline design may vary in size and shape.

NOTE 1—ANSI/ASME Subcommittee B 18.2.1 is currently preparing an American Standard to cover dimensional requirements for this product. Upon publication, these dimensions will be replaced with a reference to the American Standard for the dimensional requirements. FIG. 1 Head and Spline Dimensions Inches

### 3. Terminology

3.1 Definitions of Terms Specific to This Standard:

3.1.1 *assembly lot*—assembly lot for purposes of assigning identification numbers and from which test samples shall be selected, shall consist of one combination of component lots. That is, one tension control bolt component lot, one nut component lot, and one washer component lot which are shipped as an assembly.

<sup>&</sup>lt;sup>3</sup> Available from American National Standards Institute (ANSI), 25 W. 43rd St., 4th Floor, New York, NY 10036, http://www.ansi.org.

<sup>&</sup>lt;sup>4</sup> Available from American Institute of Steel Construction (AISC), One E. Wacker Dr., Suite 700, Chicago, IL 60601-2001, http://www.aisc.org.

# 🖽 🖗 F1852 – 11

3.1.2 component lot—component lot, for the purpose of assigning an identification number and from which test samples shall be selected, shall consist of all tension control bolts, all nuts or all washers processed essentially together through all operations to the shipping container, of which each component has the following common characteristics: heat number (mill heat); ASTM designation and grade or type, as applicable; nominal dimensions (size) and head style; heat treatment lot; and coating lot, if applicable.

3.1.3 secondary processing—any processing performed by any entity on the assemblies or individual components after initial testing.

3.1.4 *tension control bolt*—bolt that includes an integral spline end which extends beyond the threaded portion of the bolt. The fastener is to be tightened using a special electric wrench and socket system which has an inner socket that engages the spline end and with an outer socket that engages and turns the nut.

3.1.5 tension control bolt assembly-tension control bolt, nut and washer combination.

## 4. Classification

4.1 The tension control bolts are designed by type denoting chemical composition as follows:

4.1.1 Type 1-Plain carbon, carbon boron, or alloy steel.

4.1.2 Type 3—Weathering steel. Atmospheric corrosion resistance and weathering characteristics are comparable to that of steels in Specifications A242/A242M, A588/A588M, A709/A709M, A871/A871M, (see 7.1.2).

## 5. Ordering Information

5.1 Orders for assemblies shall include the items of information below. Optional items not on the purchase order shall be considered as not being required, (see Note 1):

5.1.1 Quantity of assemblies

5.1.2 Size, include nominal tension control bolt diameter and length (without the spline end)

- 5.1.3 Name of product, that is, twist off type tension control bolt/nut/washer assemblies,
- 5.1.4 Head Style (see 10.1.1),
- 5.1.5 Type of Assembly, that is; Type 1 or Type 3
- 5.1.6 ASTM designation and year of publication,
- 5.1.7 Mechanically zinc coated, if required, and
- 5.1.8 Special requirements, if required standards iteh.all

NOTE 1-A typical order description follows: 2520 assemblies, 3/4 in. diameter by 2 in. long Tension Control Bolt/Nut/Washer Assemblies, Round Heads, Type 1 ASTM F1852.

### 6. Materials and Manufacture

### 6.1 *Heat Treatment*:

6.1.1 Tension control bolts made from carbon or carbon boron steel shall be heat treated by quenching in a liquid medium from above the austenitizing temperature and then tempering by reheating to a temperature of at least 800°F ( $425^{\circ}$ C).

6.1.2 Tension control bolts made from alloy steel shall be heat treated by quenching in oil from above the austenitizing temperature and then tempering by reheating to a temperature of at least  $800^{\circ}F$  (425°C).

6.2 *Thread*—The threads of tension control bolts shall be rolled.

6.3 Mechanical Zinc Coating:

6.3.1When 6.3.1 When zinc coating is specified, each component of the assembly shall be mechanically zinc coated. The coating shall conform to Specification B695, Class 55 Type 1 as a minimum thickness.

6.3.2 Hot dip zinc coating shall not be permitted.

6.4 Lubrication— All nuts, plain and zinc coated, shall be lubricated. The lubricant shall be clean and dry to the touch.

NOTE 2-No further lubrication shall be permitted other than that applied by the manufacturer, as the type and amount of lubrication is critical to performance.

6.5 Secondary Processing:

6.5.1 If heat treatment, zinc coating, lubrication or other processing affecting properties are performed by any source on any unit of a component lot after the manufacturer's test to qualify a lot has been performed, the component lot shall be treated as newly manufactured and shall be reinspected and retested in accordance with the requirements of its original manufacturing specification after such processing is completed. Retesting shall be the responsibility of the party supplying the component.

6.5.2 Secondary processing shall not be permitted to an assembly lot.

6.6 Assembly:

6.6.1 The assemblies shall be of the type specified by the purchaser.

6.6.2 The assemblies shall consist of one tension control bolt, with one lubricated nut and one or more washer(s).

6.6.3 Nuts and washers used on the assemblies shall conform to the requirements of the specifications below:

| Assemb | olv T | vpe |
|--------|-------|-----|

| and Finish                          | Class and Finish                  | Type and Finish                      |
|-------------------------------------|-----------------------------------|--------------------------------------|
| Type 1<br>Plain <sup>4</sup>        | A563 DH Plain<br>A563 C Plain     | F436 Type 1<br>Plain                 |
| Type 1<br>Mechanical Zinc<br>Coated | A563 DH<br>Mechanical Zinc Coated | F436Type 1<br>Mechanical Zinc Coated |
| Type 3<br>Plain                     | A563 DH3 Plain<br>A563 C3 Plan    | F436Type 3 Plain                     |

<sup>A</sup> ASTM A194/A194M-2H plain nuts are a suitable alternative for Type 1 plain nuts.

6.6.4 All nuts shall be Heavy Hex. All washers used in the assembly shall be circular and through hardened.

### 7. Chemical Composition

7.1 Tension Control Bolts:

7.1.1 Type 1 tension control bolts shall be plain carbon steel, carbon boron steel, or alloy steel, at the manufacturers option, and shall conform to one of the chemical compositions specified in Table 1.

7.1.2 Type 3 tension control bolts shall be weathering steel and shall conform to one of the chemical compositions, specified in Table 2. The selection of the chemical composition A, B, C, D, E, or F, shall be at the option of the manufacturer. See Guide G101 for method of estimating the atmospheric corrosion resistance of low alloy steels.

7.1.3 Product analysis, when performed, shall be made from finished material representing each lot. To meet the specification, the chemical composition thus determined shall conform to the requirements specified in Table 1 or Table 2 as applicable.

7.1.4 Heats of steel to which bismuth, selenium, tellurium, or lead has been intentionally added shall not be permitted.

7.1.5 For Type 1 bolts made from plain carbon steel or alloy steel, heats of steel which boron has been intentionally added shall not be permitted.

7.1.6 Compliance with 7.1.4 and 7.1.5 shall be based on certification that heats of steel having any of the listed elements intentionally added were not used to produce the bolts.

| Boron                          | See 7.1.5              |                             |  |
| Alloying Elements              | A                      | A                           |  |

<sup>A</sup> Steel, as defined by the American Iron and Steel Institute, shall be considered to be alloy when the maximum of the range given for the content of alloying elements exceeds one or more of the following limits: manganese, 1.65 %, silicon, 0.60 %, copper, 0.60 %; or in which a definite range or a definite minimum quantity of any of the following elements is specified or required within the limits of the recognized field of constructional alloy steels: aluminum, chromium up to 3.99 %, cobalt, columbium, molybdenum, nickel, titanium, tungsten, vanadium, zirconium, or any other alloying elements added to obtain a desired alloying effect.

<sup>A</sup> Designations A, B, C, D, E, and F are classes of material used for Type 3 tension control bolts. Selection of a class shall be at the option of the bolt manufacturer.

<sup>B</sup> These elements are not specified or required. They shall be present only as residuals.

7.1.7 Chemical analysis shall be performed in accordance with Test Methods, Practices, and Terminology A751.

7.2 Nuts and Washers— Chemical requirements for nuts and washers shall be in accordance with the applicable specification specified in 6.6.3.

## 8. Mechanical Property Requirements for Tension Control Bolts

8.1 Hardness: The bolts shall conform to the hardness specified in Table 3.

8.2 Tensile Properties:

8.2.1 Bolts having a nominal length of three times the diameter or longer (see 8.2.3) shall be tested full size and shall conform to the tensile strength and proof load or alternative proof load specified in Table 4.

### TABLE 4 Tensile Requirements for Full Size Tension Control Bolts

| Bolt Size,<br>Threads per in.<br>and Series<br>Designation | Stress Area <sup>A</sup> in. <sup>2</sup> | Tensile Strength <sup>B</sup><br>Ibs, min, Ibf | Proof Load<br>Length<br>Measurement<br>Method, Ibs | Alternative Proof<br>Load <sup>B</sup> Yield<br>Strength Method<br>min. lbs |
|------------------------------------------------------------|-------------------------------------------|------------------------------------------------|----------------------------------------------------|-----------------------------------------------------------------------------|
| Column 1                                                   | Column 2                                  | Column 3                                       | Column 4                                           | Column 5                                                                    |
| ½ in. — 13 UNC                                             | 0.142                                     | 17 050                                         | 12 050                                             | 13 050                                                                      |
| ⅔ in. — 11 UNC                                             | 0.226                                     | 27 100                                         | 19 200                                             | 20 800                                                                      |
| ¼ in. — 10 UNC                                             | 0.334                                     | 40 100                                         | 28 400                                             | 30 700                                                                      |
| ⅓ in. — 9 UNC                                              | 0.462                                     | 55 450                                         | 39 250                                             | 42 500                                                                      |
| 1 in. — 8 UNC                                              | 0.606                                     | 72 700                                         | 51 500                                             | 55 750                                                                      |
| 11/8 in. — 7 UNC                                           | 0.763                                     | 80 100                                         | 56 450                                             | 61 800                                                                      |

<sup>A</sup> The stress area is calculated as follows:

As = 0.7854 [D- (0.9743/n)]<sup>2</sup>

where:

 $As = stress area, in.^2$ D = nominal bolt size, and

n = threads per inch.

<sup>B</sup> Loads tabulated are based on the following:

| Bolt Size, in,  | Column 3    | Column 4   | Column 5   |
|-----------------|-------------|------------|------------|
| 1/2 to 1, incl. | 120 000 psi | 85 000 psi | 92 000 psi |
| 11/8            | 105 000 psi | 74 000 psi | 81 000 psi |

8.2.2 Bolts having a <u>nominal</u> length less than three times the diameter are not subject to tensile tests, except as permitted in 8.2.3.

8.2.3 Bolts having a <u>nominal</u> length of two times the diameter or longer shall be permitted to be tested full size for tensile properties whenever suitable test equipment is available. In such cases reference to "three times the diameter" in Table 3, and 8.2.1, and 8.2.2 shall be considered to be "two times the diameter."

8.2.4 For bolts on which hardness and tension tests are performed, acceptance based on tensile requirements shall take precedence in the event of controversy over low hardness tests.

8.3 *Nuts and Washers*— Mechanical properties for nuts and washers shall be in accordance with the applicable specification in 6.6.3.

### 9. Assembly Lot Tension Test

### ASTM F1852-11

9.1 *Purpose*—The assembly lot tension test shall be performed on fastener assemblies to determine the ability of the assembly to provide the required minimum tension.

9.2 *Requirement*— Full size completed assemblies tested in accordance with 14.4 shall develop a bolt tension when the spline end is separated from the bolt conforming to the requirements in Table 5, Column 1.

### **10.** Dimensions

10.1 Tension Control Bolts:

### TABLE 5 Assembly Lot Tension Test Requirements

| Bolt Size, in.<br>Threads per in.<br>and Series Designation | Manufacturers<br>Acceptance<br>Test Tension, Ibs,<br>min <sup>4</sup> | Tension<br>1 000 of lbs (kips),<br>min (For<br>Information Only) <sup>B</sup> |
|-------------------------------------------------------------|-----------------------------------------------------------------------|-------------------------------------------------------------------------------|
|                                                             | Column 1                                                              | Column 2                                                                      |
| ½ – 13 UNC<br>⅔ – 11 UNC<br>¾ – 10 UNC                      | 13 000<br>20 000<br>29 000                                            | 12<br>19<br>28                                                                |
| 7⁄8 – 9 UNC<br>1 – 8 UNC                                    | 41 000<br>54 000                                                      | 39<br>51                                                                      |
| 11/8 – 7 UNC                                                | 59 000                                                                | 56                                                                            |

<sup>A</sup> The manufacturers acceptance test tension values are 5 % higher than the tension in Column 2 and are rounded to the nearest 1000 lbs.

<sup>B</sup> The values in Column 2 are excerpts from the Research Council Specification for Structural Joints Using ASTM A325 and A490 Bolts. They are equal to 70 % of the specified minimum tensile strength for tests of full size A325 bolts with UNC threads tested in axial tension and are rounded to the nearest 1000 pounds (kips).
