oSIST prEN ISO 19014-2:2024

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 127, *Earth-moving machinery*, Subcommittee SC 2, *Safety, ergonomics and general requirements,* in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 151, *Construction equipment and building material machines - Safety*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This first edition, together with ISO 19014-1, ISO 19014-3, ISO 19014-4 and ISO 19014-5 cancels and replaces the first editions (ISO 15998:2008 and ISO/TS 15998-2:2012), which have been technically revised.

https://standards.iteh.ai/catalog/standards/sist/3fab96bb-0260-46b0-8a1d-2444b30e03e2/osist-pren-iso-19014-2-2024

The main changes are as follows:

— Detailed Annex ZA included;

— Referenced standards dated;

— Correction to Annex D MPL error and correction to the typographical errors “MPLa” and “MPL.” in Figure D.1.

— Clause 7.3.1, diagnostic coverage, modified

A list of all parts in the ISO 19014 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user’s national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

oSIST prEN ISO 19014-2:2024

Introduction

This document addresses systems comprising all technologies used for functional safety in earth-moving machinery.

The structure of safety standards in the field of machinery is as follows:

— Type-A standards (basis standards) give basic concepts, principles for design and general aspects that can be applied to machinery.

— Type-B standards (generic safety standards) deal with one or more safety aspects, or one or more types of safeguards that can be used across a wide range of machinery:

  — type-B1 standards on particular safety aspects (e.g. safety distances, surface temperature, noise);

  — type-B2 standards on safeguards (e.g. two-hands controls, interlocking devices, pressure sensitive devices, guards).

— Type-C standards (machinery safety standards) deal with detailed safety requirements for a particular machine or group of machines.

This document is a type-C standard as stated in ISO 12100.

This document is of relevance, in particular, for the following stakeholder groups representing the market players with regard to machinery safety:

— machine manufacturers (small, medium and large enterprises);

— health and safety bodies (regulators, accident prevention organisations, market surveillance etc.)

Others can be affected by the level of machinery safety achieved with the means of the document by the above-mentioned stakeholder groups:

— machine users/employers (small, medium and large enterprises);

— machine users/employees (e.g. trade unions, organizations for people with special needs);

— service providers, e. g. for maintenance (small, medium and large enterprises);

— consumers (in case of machinery intended for use by consumers).

The above-mentioned stakeholder groups have been given the possibility to participate at the drafting process of this document.

The machinery concerned and the extent to which hazards, hazardous situations or hazardous events are covered are indicated in the Scope of this document.

When requirements of this type-C standard are different from those which are stated in type-A or type-B standards, the requirements of this type-C standard take precedence over the requirements of the other standards for machines that have been designed and built according to the requirements of this type-C standard.

oSIST prEN ISO 19014-2:2024

Earth-moving machinery — Functional safety —

Part 2: Design and evaluation of hardware and architecture requirements for safety-related parts of the control system

1 Scope

This document specifies general principles for the development and evaluation of the machine performance level achieved (MPL_a) of safety-control systems (SCS) using components powered by all energy sources (e.g. electronic, electrical, hydraulic, mechanical) used in earth-moving machinery and its equipment, as defined in ISO 6165.

The principles of this document apply to machine control systems (MCS) that control machine motion or mitigate a hazard; such systems are assessed for machine performance level required (MPL_r) per ISO 19014-1:202X or ISO 19014-5:202X.

Excluded from the scope of this document are the following systems:

— awareness systems that do not impact machine motion (e.g. cameras and radar detectors);

— fire suppression systems, unless the activation of the system interferes with, or activates, another SCS.

Other systems or components whereby the operator would be aware of failure (e.g. windscreen wipers, head lights, etc.), or are primarily used to protect property, are excluded from this document. Audible warnings are excluded from the requirements of diagnostic coverage.

In addition, this document addresses the significant hazards as defined in ISO 12100 mitigated by the hardware components within the SCS.

This document is not applicable to EMM manufactured before the date of its publication.

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 12100, ISO 13849-1, ISO 19014-1 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at https://www.electropedia.org/

3.1
ESCS
electronic safety control system
safety control system made of electronic components from input device to output device

3.2
function
defined behaviour of one or more MCS

Note 1 to entry: A control unit (e.g. electronic control unit) can execute more than one function. When multiple safety functions are contained in a control unit, each safety function and the associated circuit are analysed separately.

iTeh Standards
(https://standards.iteh.ai)
Document Preview

3.3
N/ESCS
non-electronic safety control system
safety control system made of non-electronic components from input device to output device

3.4
safe state
oSIST prEN ISO 19014-2:2024
https://standards.iteh.ai/catalog/standards/sist/51ab96bb-0260-46b0-8a11-2444b30e03e2/osist-pren-iso-19014-2-2024
condition in which, after a fault of the safety control system, the controlled equipment, process or system is automatically or manually stopped or switched into a mode that prevents unintended behaviour or the potentially hazardous release of stored energy

Note 1 to entry: A safe state can also include maintaining the *function* (3.2) of the safety control system (e.g. steering) in the presence of a single fault depending on the hazard being mitigated.

[SOURCE: ISO 3450:2011, 3.15, modified – "malfunction" has been replaced by "fault"; "performance" has been replaced by "behaviour"; Note 1 to entry has been added.]

3.5
well-tried component
component for a safety-related application that has been widely used in the past with successful results in the same or similar applications and which has been made and verified using principles which demonstrate its suitability and reliability for safety-related applications

4 Symbols and abbreviated terms

For the purposes of this document, the following symbols and abbreviated terms apply.

5 General requirements

5.1 Application

The ISO 19014 series shall be used in conjunction with the ISO 13849 series when applied to earth moving machinery (EMM) and supersedes ISO 15998. Where specific requirements are given in this document, they take precedence over the requirements in the ISO 13849 series; however, where no specific requirements are given in this document, the ISO 13849 series shall apply, using PL instead of MPL (e.g. MPL = b is analogous to PL = b). For a summary of applicable clauses in the ISO 13849 series or this document, see Tables E.1 and E.2 in Annex E.

© ISO 2023 – All rights reserved

oSIST prEN ISO 19014-2:2024

The principles of this document shall be applied to MCS that are deemed SCS in ISO 19014-1:202X or ISO 19014-5:202X. Other machine control systems that interfere with or mute a safety function of the safety control system shall be assigned the same machine performance level as the system it is interfering with or muting.

Machinery shall comply with the safety requirements and/or protective/risk reduction measures of this clause. In addition, the machine shall be designed according to the principles of ISO 12100:2010 for relevant but not significant hazards which are not dealt with by this document. Safety related software within any components within the SCS shall meet the requirements of ISO 19014-4:202X.

5.2 Existing SCS

Where an existing SCS has been developed to a previous standard and demonstrated through application usage and validation to reduce the likelihood of a hazard to as low as reasonably practicable, there shall be no requirement to update the lifecycle documentation. When the previously utilized SCS is modified, an impact analysis (see ISO 19014-4:202X, 3.28) of the modifications shall be performed and an action plan developed and implemented to ensure that the safety requirements are met.

6 System design

6.1 Overview

Many safety functions on mobile machines do not have run/stop outputs like non-mobile machine safety functions normally do and are not always added to a machine purely to mitigate a hazard. For example, steering, service brakes, swing, and equipment controls can have modulated or variable outputs within a certain range. While these types of systems can fit into the ISO 13849 architectures, designers need to consider how the characteristics of the safety functions can differ on a mobile machine (e.g. does the system need closed loop control rather than open loop to address incorrect application rates, does the system need to address hazards associated with uncommanded activation as well as failure on demand etc.).

A safety function which relies on a control system to provide necessary hazard mitigation for the machine can be implemented by an SCS within the scope of this document. An SCS can contain one or more SRP/CS, and several SCS can share one or more SRP/CS (e.g. a logic unit, power control elements). It is also possible that one SRP/CS implements both safety and non-safety functions.

iTeh Standards
(https://standards.iteh.ai)
Document Preview
https://standards.iteh.ai/catalog/standards/sist/...e2/osist-pren-iso-19014-2-2024

NOTE For immediate action warning indicators, refer to ISO 19014-1:2018, Annex B.

Some systems on mobile machines need to maintain an operable state during a failure. While ISO 13849-1:2015 allows for this, additional measures are necessary to ensure this happens safely and that parallel channels do not conflict with each other and that the systems function as the requirements for the claimed architecture specifies.

Annex C sets the minimum requirements that shall be met for utilizing systems, sub-systems and SRP/CS developed and evaluated by methods other than the ISO 19014 series.

6.2 General requirements

After the safety functions of the SCS have been identified, the safety function requirements shall be documented. During the safety lifecycle, safety requirements are detailed and specified in greater detail at hierarchical levels. All safety requirements shall be described such that they are unambiguous, consistent with other requirements, and feasible to implement.

The following design considerations shall be taken into account:

— conflicting input or output signals;

— loss of signal and actuation energies to either system (e.g. separate oil supplies for each channel, redundant power supplies for ECUs);

© ISO 2023 – All rights reserved

oSIST prEN ISO 19014-2:2024

— conflicting safe states required by multiple failure types that are being addressed by the system;

— systems that require fail-operational functionality;

— the assessment processes are independent from the design process;

— when SCS are designed to be used in a synchronized manner (e.g. task automation), the control system shall be designed to mitigate hazards due to lack of synchronization.

NOTE An EMM example of this synchronization is an excavator boom, arm, and bucket being controlled simultaneously by a grade control system.

6.3 Hardware design

The hardware structure of the SCS can provide measures (e.g. redundancy, diversity, and monitoring) for avoiding, detecting, or tolerating faults. Practical measures can include redundancy, diversity, and monitoring.

The hardware development process shall follow ISO 13849-1:2015 as outlined in Annex E. The designer should begin at the system level where safety functions and associated requirements are identified. The system may be decomposed into subsystems for easier development.

Where applicable, each phase of the development cycle shall be verified.

See Figure 1 for a depiction of the hardware development process in the form of a V-model. Any organized, proven design process which meets the requirements of the ISO 19014 series may be used to complete the design process.

7 System safety performance evaluation

7.1 Machine performance level achieved (MPL_a)

The achieved integrity of safety-related parts to perform a safety function is expressed through the determination of the MPL_a.

The ability to perform a safety function under expected environmental conditions as specified in ISO 19014-3:202X shall be demonstrated and documented.

The procedure for evaluating MPL_a is as follows:

a) identify the component operating environment and stress level;

b) identify components;

c) identify and document fault exclusions (7.2), or by using the appropriate system analysis (e.g. FMEA, fault-tree analysis, etc.);

d) calculate the $MTTF_d$ (see ISO 13849-1:2015, Annex D,), and verify the $MTTF_d$ meets the required level (see ISO 13849-1:2015);

e) determine if the hardware can provide the required level of DC (ISO 13849-1:2015, Annex E). For systems relying on software interaction to determine diagnostic coverage, this analysis can only determine if the hardware is available to support DC, not verify that the DC requirement for the system has been met;

f) consider CCF (see ISO 13849-1:2015, Annex F) if required;

g) consider systematic failure (ISO 13849-1:2015, Annex G);

h) consider possible interaction from other safety functions;

i) for FPGA and ASIC design, see IEC 61508-2:2010, Annexes E or F.

For systems assessed in the MCSSA to qualify for QM, a quality management system (e.g. ISO 9001 or equivalent) shall be used.

oSIST prEN ISO 19014-2:2024
https://standards.iteh.ai/catalog/standards/sist/51ab96bb-0260-46b0-8a1d-2444b30e03e2/osist-pren-iso-19014-2-2024

See Annex D for supplementary information on safety function evaluation.

7.2 Hardware safety evaluation

7.2.1 General

ISO 13849-2:2012, Annexes A to D list the faults, fault exclusions and failures for various types of components; these lists are not exhaustive. If necessary, additional faults, fault exclusions, and failures shall be considered and listed; in such cases, the method of evaluation should also be clearly elaborated.

A failure mode and effects analysis (FMEA), fault-tree analysis, or equivalent system analysis shall be performed to establish the faults and fault exclusions.

7.2.2 Fault consideration

In general, the following fault criteria can be considered:

— if, because of a fault, further components fail, the first fault together with all following faults shall be considered as a single fault;

— two or more faults having a common cause shall be considered as a single fault (known as a CCF);

© ISO 2023 – All rights reserved
