About the IEC

The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications

The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform

The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee,...). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished

Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc

If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

Electropedia - www.electropedia.org

The world's leading online dictionary on electrotechnology, containing more than 22 000 terminological entries in English and French, with equivalent terms in 16 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

IEC Glossary - std.iec.ch/glossary

67 000 electrotechnical terminology entries in English and French extracted from the Terms and definitions clause of IEC publications issued between 2002 and 2015. Some entries have been collected from earlier publications of IEC TC 37, 77, 86 and CISPR.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

ELECTROSTATICS –

Part 1: Electrostatic phenomena – Principles and measurements

FOREWORD

- 1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
- 2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
- 3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
- 4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
- 5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
- 6) All users should ensure that they have the latest edition of this publication.
- 7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
- 8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
- 9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

This consolidated version of the official IEC Standard and its amendment has been prepared for user convenience.

IEC TR 61340 edition 1.1 contains the first edition (2012-06) [documents 101/344/DTR and 101/355/RVC] and its corrigenda 1 (2013-03) and 2 (2017-12), and its amendment 1 (2020-06) [documents 101/598/DTR and 101/604/RVDTR].

In this Redline version, a vertical line in the margin shows where the technical content is modified by amendment 1. Additions are in green text, deletions are in strikethrough red text. A separate Final version with all changes accepted is available in this publication.

The main task of IEC technical committees is to prepare International Standards. However, a technical committee may propose the publication of a technical report when it has collected data of a different kind from that which is normally published as an International Standard, for example "state of the art".

IEC TR 61340-1, which is a technical report, has been prepared by IEC technical committee 101: Electrostatics.

This publication has been drafted in accordance with the ISO/IEC Directives, Part 2.

A list of all the parts in the IEC 61340 series, published under the general title *Electrostatics*, can be found on the IEC website.

The committee has decided that the contents of the base publication and its amendment will remain unchanged until the stability date indicated on the IEC web site under "http://webstore.iec.ch" in the data related to the specific publication. At this date, the publication will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

iTeh STANDARD PREVIEW

IMPORTANT – The 'colour inside' logo on the cover page of this publication indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

<https://standards.iteh.ai/catalog/standards/sist/3319d583-f131-4ec9-a935-9ac5bb897639/iec-tr-61340-1-2012>

INTRODUCTION

Static electricity has been known for around 2 500 years but until recently had little impact on humankind. More recently in the last century the nature of static electricity became better understood and the principles of charge separation and accumulation could be described. Despite this improved understanding, it remains difficult to predict with certainty the polarity and magnitude of charges built up in any situation due to the many factors involved, and to, many electrostatics remains a “black art” rather than a science.

The development of modern materials, especially polymers, and their nearly ubiquitous application in fields such as floor materials, furnishings, clothing and engineering materials, has made static electricity an everyday phenomenon. In some industries, such as electronics manufacture and processes using flammable materials, unintended and invisible electrostatic discharges can lead to substantial component damage or unreliability, or fires or explosions. In everyday life, experience of electrostatic shocks to personnel has become commonplace. This has led to increasing need to understand such phenomena, and to specify materials, equipment and procedures for use in preventing and controlling electrostatic problems in the human environment.

This technical report gives an overview of the field of electrostatics and has been prepared to give the user a view of the background, principles, methods of measurement and industrial applications prepared in conformity with IEC TC101 publications.

ELECTROSTATICS –

Part 1: Electrostatic phenomena – Principles and measurements

1 Scope

This part of IEC 61340, which is a technical report, describes the fundamental principles of electrostatic phenomena including charge generation, retention and dissipation and electrostatic discharges.

Methods for measuring electrostatic phenomena and related properties of materials are described in a general way.

Hazards and problems associated with electrostatic phenomena and principles of their control are outlined.

Useful applications of electrostatic effects are summarized.

The purpose of this technical report is to serve as a reference for the development of electrostatics related standards, and to provide guidance for their end-users.

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

3.1

antistatic additive

antistatic filler, antistatic treatment

substance added to, or process applied to a liquid or solid in order to reduce its tendency to acquire a charge by contact and rubbing, or to promote more rapid charge migration and so to reduce its ability to retain significant charge when in contact with earth

3.2

antistatic

refers to the property of a material that inhibits or limits triboelectric charging

3.3

bonding

electrical connection between two or more conducting objects that reduces the potential difference between them to an insignificant level

3.4

breakdown

failure, at least temporarily, of the insulating properties of an insulating medium under electric stress

3.5

breakdown voltage

voltage at which breakdown occurs, under prescribed conditions of test or use

3.6

charge decay

neutralization or migration of charge across or through a material leading to a reduction of charge density or surface potential at the point where the charge is deposited

3.7

charge decay time

charge relaxation time

time taken for charge to decay from a specified value to a specified lower value

Note 1 to entry: The specified lower value is commonly one tenth or 1/e of the starting value ($e = 2,718$).

3.8 **conductivity**

ability of the substance to conduct electrical current expressed as $S \times m^{-1}$

3.9 **conductor or conductive material**

object or material providing a sufficiently high conductivity so that potential differences over any parts of it are not sufficiently large as to be of practical significance

Note 1 to entry: In general this is a material having a resistance below about $10^5 \Omega$ but different standards may define different resistance ranges for this term.

3.10 **dissipative material**

material which allows charge to migrate over its surface and/or through its volume in a time that is short compared to the timescale of the actions creating the charge or that will cause an electrostatic problem

Note 1 to entry: In general a material having a resistance approximately $10^5 \Omega$ and below approximately $10^{11} \Omega$ is considered to be dissipative. Different standards may disagree on the exact values of the limits.

3.11 **earth, earthing, grounding**

ground

electrical connection (bonding) of a conductor to the main body of the earth to ensure that it is at earth potential

3.12 **electrostatic discharge**

ESD

transfer of charge by direct contact or by breakdown from a material or object at a different electrical potential to its immediate surroundings

3.13 **explosion groups**

flammable gaseous atmospheres subdivided into explosion groups I, IIA, IIB and IIC to define their inflammability

Note 1 to entry: The most sensitive explosion group is Group IIC.

Note 2 to entry: See ~~[9] to [11]~~ [10]¹ for definitions of classification method.

3.14 **flammable substance**

substance in the form of gas, liquid, solid or mixture of these, capable of propagating combustion when subjected to a sufficiently strong ignition source

3.15 **hazard threshold voltage**

minimum electrical potential of capacitive stored charge that may give rise to an electrostatic hazard

3.16 **hazardous area**

area in which flammable substance is, or may be expected to be, present in quantities such as to require special precautions against ignition

¹ References in square brackets refer to the bibliography.

Note 1 to entry: Hazardous area zones are defined in IEC 60079-10-1 and IEC 60079-10-2.

3.17

insulator

insulative material

material with very low mobility of charge so that any charge on the surface will remain there for long time

Note 1 to entry: Connecting an insulator to earth does not help charge migration.

3.18

minimum ignition energy

MIE

smallest amount of energy released in a capacitive electrical spark that can ignite a mixture of a specified flammable material with air or oxygen, according to a defined procedure

3.19

relaxation of charge

migration or neutralization of charge over and/or through a solid, liquid or gaseous material causing a reduction in surface charge density and energy

Note 1 to entry: If the potential of a surface is defined then this is also reduced.

3.20

surface charge density

σ_s

net quantity of charge per unit area of surface of a solid or liquid

3.21

surface resistivity

Ω

resistance between opposing sides of a square on the surface of a material

3.22

triboelectric charging

electrical charging process in which charge is generated by the contact and separation of two surfaces which may be solid, liquid or particle-carrying gases

3.23

volume charge density

σ_v

net quantity of charge per unit volume of a solid, liquid or gas

3.24

volume resistivity

$\Omega \times m$

resistance between opposing sides of 1 m³ of the material

4 Fundamentals of static electricity

4.1 General

Generally, electrostatic charge on a material, product or object is the result of:

- contact and rubbing;
- charge transfer;
- induction in an electric field;
- effect of polarization;

- photoelectric effect;
- pyroelectric effect;
- piezoelectric effect;
- ionization and ions adsorption;
- electrochemical processes.

However, the primary source of electrostatic charge is triboelectric charging. If two previously uncharged substances come into contact, charge transfer will, in general, occur at their common boundary. If a gas containing solid particles or liquid droplets in suspension becomes charged by contact and separation, then the gas can be seen as carrying an electrostatic charge. On separation, each surface will carry an additional charge of equal magnitude but of opposite polarity. Conducting or dissipative objects can become charged by induction if they reside in an electric field produced by other charged objects or conductors at high potential in their vicinity. Any object can become charged if charged particles or molecules accumulate on it.

It is very important to have some appreciation of these phenomena in order to enable the proper implementation of test procedures and unambiguous interpretation of the resultant data. It is also important with regard to choice of electrodes, protection of current measuring devices from the initial capacitive surge and the time at which the value is recorded. The latter should, of course, be appropriate to meet the practical circumstance for which the data are required. Further comments are included in this technical report with the descriptions of the individual test methods, where considered necessary.

4.2 Contact electrification

Contact electrification can occur at solid/solid, liquid/liquid or solid/liquid interfaces. Clean gases cannot charge materials in this way. If a gas contains solid particles or liquid droplets in suspension, however, these may be charged by contact so that such a gas can carry an electrostatic charge by virtue of these particles.

In the case of solids of different materials, initially uncharged and normally at earth potential, charge is transferred from one material to the other when they make contact. When they separate, a net positive charge remains on the one surface and a net negative charge on the other surface. The quantity of charge is increased by the size of the contact areas and the size is affected by the contact pressure. Additional rubbing also increases the effective contact area.

The relative amounts and polarity of charge transferred between materials can be presented as a list, referred to as the triboelectric series. A material is expected to charge positively against materials lower in the series, and negatively against materials higher in the series. It should be noted that the position of a material in the triboelectric series is an approximation, dependent on test conditions, and that two samples of the same material rubbed against each other can result in quite strong charging.

Examples of triboelectric series are shown in Table 1.
