### Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see <a href="https://www.iso.org/directives">www.iso.org/directives</a>).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see <a href="https://www.iso.org/patents">www.iso.org/patents</a>).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see <a href="https://www.iso.org/iso/foreword.html">www.iso.org/iso/foreword.html</a>.

This document was prepared by Technical Committee ISO/TC 45, *Rubber and rubber products*, Subcommittee SC 4, *Products (other than hoses)*.

A list of all parts in the ISO 22762 series can be found on the ISO website. 459c-af7d-

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at <u>www.iso.org/members.html</u>.

### Introduction

This document specifies requirements and test conditions for elastomeric seismic isolators used for important buildings and buildings which can be subjected to frequent, large earthquakes; the requirements and test conditions for the rubber material used in the manufacture of such isolators are also specified.

Three grades of requirements for each test item are introduced. Grade I requirements for each test item conform with the requirements given in ISO 22762-3 and are appropriate for standard buildings unlikely to be subjected to frequent, large earthquakes. Grade II and grade III requirements for each test item have to meet the more stringent requirements and be subjected to the more severe test conditions given in this document. Grade III requirements for each test item are intended for the most important buildings, and sites where large earthquakes can be particularly frequent.

There are a wide variety of requirements for seismic isolated buildings; there is no need to request the same grade for all test items in the same project. Structural engineers may select grade II or III for each test item in their requirements in order to perform the optimum building design.

Instances where this document differs from ISO 22762-3 include:

- a) the number of test pieces to be used in type testing;
- b) smaller tolerances allowed between measured properties and design characteristics;
- c) smaller variations, due to effects such as temperature and compressive load, allowed in shear properties.

### Elastomeric seismic-protection isolators —

### Part 6: High-durability and high-performance specifications and test methods

#### 1 Scope

This document specifies specifications and test methods for elastomeric seismic isolators used for buildings to guarantee high durability and high performance.

It is applicable to elastomeric seismic isolators used to provide buildings with protection from earthquake damage. The isolators covered consist of alternate elastomeric layers and reinforcing steel plates. They are placed between a superstructure and its substructure to provide both flexibility for decoupling structural systems from ground motion, and damping capability to reduce displacement at the isolation interface and the transmission of energy from the ground into the structure at the isolation frequency.

### 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 22762-3:2018, Elastomeric seismic-protection isolators — Part 3: Applications for buildings — Specifications

#### 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <u>https://www.iso.org/obp</u>
- IEC Electropedia: available at <u>https://www.electropedia.org/</u>

#### 3.1

#### allowable tensile strain

tensile strain whose influence on shear properties does not exceed a certain range

#### 3.2

breaking

rupture of *elastomeric isolator* (3.8) due to compression- (or tension-) shear loading

#### 3.3

#### buckling

state when *elastomeric isolators* (3.8) lose their stability under compression-shear loading

3.4

#### compressive properties

 $K_{\rm v}$ 

compressive stiffness for all types of rubber bearings

#### 3.5

#### cumulative shear strain

sum of shear strain of a seismic-protection isolator when it is repeatedly deformed many times

#### 3.6

#### design compressive stress

long-term compressive force on the *elastomeric isolator* (3.8) imposed by the structure

#### 3.7

#### effective width

rectangular *elastomeric isolator* (3.8) smaller of the two side lengths of inner rubber to which direction shear displacement is not restricted

#### 3.8

#### elastomeric isolator

rubber bearing, for seismic isolation of buildings, bridges and other structures, which consists of multilayered vulcanized rubber sheets and reinforcing steel plates

EXAMPLE High-damping rubber bearings, linear natural rubber bearings and lead rubber bearings.

#### 3.9

### first shape factor

ratio of effectively loaded area to free deformation area of one inner rubber layer between steel plates

#### 3.10

#### high-damping rubber bearing HDR

*elastomeric isolator* (3.8) with relatively high damping properties obtained by special compounding of the rubber and the use of additives

#### 3.11

#### horizontal biaxial loading dependency

horizontal biaxial loading effect on various properties

#### 3.12

#### horizontal shear creep test and residual shear strain test

changes in horizontal deformation that occur when the *elastomeric isolator* (3.8) is subjected to a constant horizontal force for a long time due to strong winds such as a typhoon, and residual deformation after unloading

#### 3.13

#### inner rubber

rubber between multi-layered steel plates inside an *elastomeric isolator* (3.8)

#### 3.14

#### lead rubber bearing

#### LRB

*elastomeric isolator* (3.8) with a lead plug or lead plugs press fitted into a hole or holes of the isolator body to achieve damping properties

#### 3.15

#### linear natural rubber bearing

LNR

*elastomeric isolator* (3.8) with linear shear force-deflection characteristics and relatively low damping properties, fabricated using natural rubber

Note 1 to entry: Any bearing with relatively low damping can be treated as an LNR bearing for the purposes of isolator testing.

#### 3.16

#### roll-out

instability of an isolator with either dowelled or recessed connection under shear displacement

#### 3.17

#### routine test

test for quality control of the production isolators during and after manufacturing

#### 3.18

#### second shape factor

<circular elastomeric isolator> ratio of the diameter of the *inner rubber* (3.13) to the total thickness of the inner rubber

#### 3.19

#### second shape factor

<rectangular or square elastomeric isolator> ratio of the *effective width* (3.7) of the *inner rubber* (3.13) to the total thickness of the inner rubber

#### 3.20

#### shear strain dependency of allowable tensile strain

influence of the *allowable tensile strain* (3.1) due to a change of shear strain of *elastomeric isolator* (3.8)

#### 3.21

#### <u>SO 22762-6:2022</u>

shear strain dependency of tensile yield strength/sist/05dd3fac-d778-459c-af7d-

influence of the tensile yield strength due to a change of shear strain of *elastomeric isolator* (3.8)

#### 3.22

#### standard value

value of the isolator property defined by the manufacturer based on the results of the type test

#### 3.23

#### structural engineer

engineer in charge of designing the structure for base-isolated bridges or buildings and responsible for specifying the requirements for *elastomeric isolators* (3.8)

#### 3.24

#### tensile fracture strain

strain at which *elastomeric isolator* (3.8) breaks in the tensile direction

#### 3.25

#### type test

test for the verification of either material properties and isolator performances during the development of the product or the achievement of the project design parameters

#### 3.26

#### ultimate property

property at either *buckling* (3.3), *breaking* (3.2), or *roll-out* (3.16) of an isolator under compression-shear loading

#### 3.27

#### ultimate properties under horizontal biaxial loading test

critical characteristics of *elastomeric isolators* (3.8) when loaded in two directions in the horizontal plane

#### 3.28

#### ultimate property diagram

UPD

diagram giving the interaction curve of compressive stress and *buckling* (3.3) strain or *breaking* (3.2) strain of an *elastomeric isolator* (3.8)

#### 4 Symbols

For the purposes of this document, the symbols given in <u>Table 1</u> apply.

| Symbol                      | Description  |
|-----------------------------|--|
| h <sub>eq</sub>             | equivalent damping ratio   |
| K <sub>d</sub>              | post-yield stiffness (tangential stiffness after yielding of lead plug) of lead rubber bearing |
| K <sub>h</sub>              | shear stiffness  |
| P <sub>Tb</sub>             | tensile force at break of isolator   |
| P <sub>Ty</sub>             | tensile yield force CTANDARD PREVIEW   |
| Q <sub>d</sub>              | characteristic strength  |
| <i>S</i> <sub>1</sub>       | first shape factor (standards iten ai)   |
| S <sub>2</sub>              | second shape factor  |
| $\gamma_{\rm max}$          | maximum shear displacement   |
| $\gamma_0$                  | design shear strain  |
| $\gamma_{\varphi}$          | maximum torsion strain 229387112b95/iso-22762-6-2022   |
| $\gamma_{\rm b}$            | ultimate shear strain under horizontal biaxial loading   |
| $\gamma_{\rm max}$          | maximum design shear strain during earthquake  |
| $\gamma_{\rm u}$            | ultimate shear strain under horizontal uniaxial loading  |
| $\varepsilon_{\mathrm{Tl}}$ | allowable limit of tensile strain  |
| $	au_{\mathrm{B}}$          | shear stress in bolt   |
| τ <sub>s</sub>              | shear static stress  |

#### Table 1 — Symbols and descriptions

#### **5** Classification

The requirements for each test item of elastomeric seismic-protection isolators are classified into three grades, grade III, grade II, and grade I, depending on durability and performance. Grade III and grade II are high-endurance and high-performance specifications stipulated in this document, and the grade I is a general specification prescribed by ISO 22762-3. In addition, grade III is more durable and has higher performance specification than grade II.

The classification of each grade is shown in <u>Table 2</u>. Requirements for grade III and grade II are listed in <u>6.5</u>.

Structural engineers may select grade II or III for each test item in their requirements in order to perform the optimum building design.

| Grade | Required items of<br>performance evaluation  | Required performance level                                     | Required specimens   |
|-------|--|--|--|
| Ι     | Required items of performance<br>evaluation are as in ISO 22762-<br>3:2018, Table 5.     | Required performance level is as in ISO 22762-3:2018, Table 3. | Required specimens are as in<br>ISO 22762-3:2018, Table 4.   |
| II    | Some new performance items<br>such as tensile property are<br>added to those of grade I. |  | For some performance items, required<br>number and size of specimens are<br>larger than grade I. In addition, for<br>some performance items, required<br>test condition is severer than grade I.   |
| III   |  |  | For some performance items, required<br>number and size of specimens are<br>larger than grade II. In addition, for<br>some performance items, required<br>test condition is severer than grade II. |

Table 2 — Classification of each grade

#### **6** Requirements

#### 6.1 General

Elastomeric isolators for buildings and the materials used in manufacture shall meet the requirements specified in this clause. Test items for type test of isolators are shown in <u>Table 3</u>.

## 6.2 Type tests and routine tests dards.iteh.ai)

Type tests and routine tests are specified in ISO 22762-3:2018, 6.2.

#### SO 22762-6:2022

6.3 Functional requirements catalog/standards/sist/05dd3fac-d778-459c-af7d-

Functional requirements of elastomeric isolators used for buildings are specified in ISO 22762-3:2018, 6.3.

#### 6.4 Design compressive force and design shear displacement

The design compressive forces, the design shear displacements, the design stress and the design strain of an isolator are defined in ISO 22762-3:2018, 6.4.

#### 6.5 Performance requirements

#### 6.5.1 General

The performance requirements of grade II and III are shown below.

The isolators shall be tested and the results recorded using the specified test methods. They shall satisfy all of the requirements of Grade II and III listed in <u>Table 3</u>. The test items are summarized in <u>Table 3</u> for type tests and routine tests. The standard value obtained from the tests shall be reported. The standard temperature for determining the properties of elastomeric isolators is specified in ISO 22762-3:2018, 6.1. Double-shear configuration testing (see ISO 22762-1:2018, 6.2.2.2) can be employed with the approval of the structural engineer.

The standard values obtained from the tests satisfy the requirements shown in <u>Table 4</u>, <u>Table 5</u> and <u>Table 6</u> depending to the type of isolators.

| Property                                    | Test item  | Test item Test method  |     | Type test |  |
