Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 156, *Corrosion of metals and alloys*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 219, *Cathodic protection*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

Cathodic protection (CP), possibly together with protective coating, is applied to protect the immersed external surfaces of offshore wind farm structures and appurtenances from corrosion due to seawater or seabed environments.

CP, possibly together with protective coating, can be applied to protect the internal flooded and seabed and sediment exposed surfaces from corrosion.

The general principles of CP in seawater are detailed in ISO 12473.

CP involves the supply of sufficient direct current to the surfaces of the structure in order to reduce the steel to electrolyte potential to values where corrosion is considered insignificant or acceptably low.

CP is designed to protect the submerged and buried areas of the structure from corrosion. The parts that are not permanently immersed will not be permanently protected by the CP system.

This document introduces guidance for the use of available metocean data to

- assess the CP demand of immersed and frequently wetted areas
- determine seawater flow velocities to assess the CP design parameters

This is in addition to the primary use of the metocean data in structural design.

This document does not require the CP designer to be expert in metocean data; it gives guidance on data which should be available from metocean specialists and which is required in the CP design process.

Cathodic protection of offshore wind structures

1 Scope

This document specifies the requirements for the external and internal cathodic protection for offshore wind farm structures. It is applicable for structures and appurtenances in contact with seawater or seabed environments. This document addresses:

- design and implementation of cathodic protection systems for new steel structures;
- assessment of residual life of existing cathodic protection systems;
- design and implementation of retrofit cathodic protection systems for improvement of the protection level or for life extension of the protection;
- inspection and performance monitoring of cathodic protection systems installed on existing structures, and
- guidance on cathodic protection of reinforced concrete structures.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 12473, *General principles of cathodic protection in seawater*

EN 12496, *Galvanic anodes for cathodic protection in seawater and saline mud*

ISO 12696, *Cathodic protection of steel in concrete*

ISO/IEC 17025, *General requirements for the competence of testing and calibration laboratories*

EN 60529, *Degrees of protection provided by enclosures (IP Code)*

IEC 61000-1-2, *Electromagnetic compatibility (EMC) — Part 1-2: General — Methodology for the achievement of functional safety of electrical and electronic systems including equipment with regard to electromagnetic phenomena*

IEC 61400-24, *Wind energy generation systems — Part 24: Lightning protection*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1
atmospheric zone

zone located above the splash zone

3.2
buried zone

zone located under the seabed or expected scour level, whichever is lower

3.3
CP design life

time for which the CP is designed to protect the structure

Note 1 to entry: This may be different to the structure design life or structure service life.

3.4
doubler plate

plate welded onto a member to locally reinforce it or to isolate it from further welding work

3.5
electrolyte

medium in which electric current is transported by ions. In the context of this document, seawater or seabed

3.6
frequently wetted zone

FWZ

water level, WL(t), plus significant wave height, H_{mo}

Note 1 to entry: See [Annex B](#) for details.

3.7
free board level

FBL

water level for floating structures

3.8
HAT
highest astronomical tide

level of the highest astronomical tide

3.9
hybrid cathodic protection system

system comprising both impressed current and galvanic anodes

3.10
inspection

examination of equipment to determine its continued performance characteristics, whether undertaken on a regular program basis or carried out as a simple operation

3.11
IR error

error in measured steel to electrolyte potential caused by the protection current or any other current flowing through the resistive environment

3.12
jacket structure

multi-legged lattice braced structure

3.13**J-tube**

curved tubular conduit designed and installed on a structure to support and guide cables

3.14**LAT****lowest astronomical tide**

level of the lowest astronomical tide

3.15**marine sediments**

top layer of the seabed composed of water saturated solid materials of various densities

3.16**metocean data**

meteorological and oceanographic data, often given as hourly statistics

3.17**monitoring**

activity continuously on-going or sporadically undertaken at fixed locations to determine the performance of a CP system or parameters related to the performance

Note 1 to entry: Typically, monitoring utilizes fixed sensors, the data from which can be data logged.

3.18**monopile**

foundation element driven or drilled into the seabed to support a transition piece and/or tower

3.19**over-polarization**

occurrence in which the structure to electrolyte potentials are more negative than those required for satisfactory cathodic protection

Note 1 to entry: Over-polarization provides no useful function and might even cause damage to the structure

3.20**owner**

structure owner, or developer or operator, all or any of which may have responsibility for matters related to corrosion protection

3.21**primary steel**

primary load carrying elements (monopile, jacket, hull and other steel structures)

3.22**re-polarization**

situation where the steel is polarized after a depolarization event

3.23**retrofit cathodic protection**

provision of CP equipment, either as a complete or a partial system, to an existing structure either to remedy CP performance deficiencies or to extend the CP system life

3.24**salinity**

quantity of inorganic salts dissolved in the seawater

Note 1 to entry: The standardised measurement is based on the determination of the electrical conductivity of the seawater.

Note 2 to entry: Salinity is expressed in grams per kilogramme (g/kg) or as parts per thousand (ppt or ‰).

3.25

scour

removal of seabed soils by sea currents and waves or caused by structural elements interrupting the natural flow regime above the sea floor

3.26

seabed

interface between seawater and solids of the *buried zone* (3.2) including the *marine sediments* (3.15)

3.27

secondary steel

steel which is not primary steel, hence used for access (boat landing, ladders, decks and support for equipment)

3.28

shallow water

water of such depth that surface waves are noticeably affected by bottom topography

Note 1 to entry: Typically, this implies a water depth equivalent to half the wavelength^[33]. For all practical purposes in this document, it is understood as depth less than –30 m LAT

3.29

significant wave height

H_{mo}

mean level of the third largest waves in open sea

3.30

splash zone

external region of support structure that is frequently wetted due to the wave and tidal variations. A more detailed definition of splash zone is given in IEC 61400-3-1^[15]. In this document the frequently wetted zone is included as the upper boundary to which current demand for CP shall be included

3.31

structure service life

anticipated life of the windfarm structure.

Note 1 to entry: This includes a period for storage, transport, installation, operating the wind farm and a possible period for decommissioning

3.32

suction bucket

foundation element that is sucked into the seabed

3.33

surveying

process of carrying out inspection using a defined procedure

Note 1 to entry: In this document surveying is also used to describe the process of taking cathodic protection measurements, not using fixed and data logged sensors, but using a defined procedure

3.34

tidal zone

zone located between LAT and HAT

3.35

transition piece

intermediate structure between the monopile and the tower

3.36

wave crest and trough

height of seawater above and depth of below still water level due to waves

Note 1 to entry: See [Figure 1](#) below.**Key****Key to distance elevation**

- 1 lowest astronomical tide (LAT)
- 2 mean sea level (MSL)
- 3 highest astronomical tide (HAT)
- 4 tidal range
- 5 tidal datum (commonly LAT or MSL but may be other)

- 6 tide associated with storm (shown positive but may be positive or negative)
- 7 storm surge (shown positive but may be positive or negative)
- 8 still water (or "storm water") level
- 9 crest elevation
- 0 trough elevation

Key line types

- seafloor
- tide levels
- surge or surge+tide levels
- wave profile

Figure 1 — Water depth, tides and storm surges, from ISO 19901-1^[10]**4 Symbols and abbreviations****4.1 Symbols**

- A Area, m^2
- C Anode cross section periphery, m
- c Coating degradation, %

ΔU	Driving potential, V
f_c	Coating breakdown factor
I	Current, A
$I_{\text{anode(initial)}}$	Initial current output of an individual galvanic anode material, A
$I_{\text{anode(final)}}$	Final current output of an individual galvanic anode material, A
I_{max}	Maximum protection current demand for a CP zone, A
$I_{\text{total(initial)}}$	Total current required for polarization of the structure, A
$I_{\text{total(final)}}$	Total current required for re-polarization of the structure, A
J	Current density, A/m ²
L	Anode body length, m
L_{initial}	Anode initial length, m
L_{final}	Anode final (or end of life) length, m
N	Number of anodes
Q	Practical electrochemical capacity for the anode alloy in the environment considered, Ah/kg
ρ	Resistivity of an electrolyte, Ωm . In this document resistivity may be of an electrolyte (sea or seabed) or a conductor material
R_a	Anode resistance to remote earth, Ω . In the context of this document, remote earth will be in seawater or seabed
r	Anode radius, m
R	Circuit resistance, Ω
S	Arithmetic mean of anode length and width, m
T	Temperature, $^{\circ}\text{C}$
T_{anode}	Effective lifetime of the anode, years
T_{design}	Required design life, years
U	Flow velocity (m/s)
u	Utilisation factor for CP design calculations
V_{initial}	Initial net volume of anode alloy (excluding the steel insert), m ³
V_{insert}	Volume of the insert only within the anode body, m ³
V_{final}	Final (or end of life) net volume of anode alloy, m ³
V_{gross}	Overall volume of the anode body including that portion of the insert only within the anode body, m ³
m_{anode}	Net mass of an individual galvanic anode material, kg
m_{total}	Minimum total net mass of galvanic anode material, kg
