<https://standards.iteh.ai/catalog/standards/sist/538c56fa-849b-44fa-bb74-b2f14a7d0c1b/iso-13703-3-2023>

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 67, *Oil and gas industries including lower carbon energy*, Subcommittee SC 6, *Process equipment, piping, systems, and related safety*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 12, *Materials, equipment and offshore structures for petroleum, petrochemical and natural gas industries*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This first edition of ISO 13703-3, together with ISO 13703-1 and ISO 13703-2, cancels and replaces ISO 13703:2000. It also incorporates the Technical Corrigendum ISO 13703:2000/Cor.1:2002.

The main changes compared to the previous edition are as follows:

- deletion of the installation and quality control requirements of [Clause 10](#);
- deletion of previous Annex C as requirements are addressed in ASME B31.3.

A list of all parts in the ISO 13703 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

The aim of this document is to establish common requirements for the fabrication, welding, inspection, examination and testing of new, metallic process piping systems designed in accordance with the requirements of ISO 13703-1, and using bulk piping materials in accordance with ISO 13703-2.

This document makes normative reference to ASME B31.3 as the base code for process piping. Alternative codes to ASME B31.3 exist for the fabrication, welding, inspection, examination and testing of process piping systems along with the potential need to comply with local or national regulatory/jurisdictional requirements. The user of this document is expected to assess the implications arising from local or national regulatory/jurisdictional requirements in implementing the requirements herein, including the need to specify additional requirements to those stated. ASME B31.3, Appendix N provides guidance on its use internationally, and specifically its use within the European Union for which additional requirements to those specified in ASME B31.3 will be necessary to meet the requirements of Directive 2014/68/EU on the harmonization of the laws of the Member States relating to the making available on the market of pressure equipment (PED).

This document is not intended to inhibit a user from accepting alternative fabrication, welding, examination or testing solutions for the individual application. This can be particularly appropriate where there is innovative or developing technology. Where an alternative to the requirements in this document is offered, the user is expected to review the implications in meeting the performance requirements within this document.

Oil and gas industries including lower carbon energy — Piping systems on offshore production platforms and onshore plants —

Part 3: Fabrication

1 Scope

This document specifies requirements for the fabrication, installation, welding, inspection, examination and testing of new, metallic piping systems, within temperature range limits for the materials meeting the requirements of ASME B31.3, on fixed and floating offshore production facilities and onshore production, processing and gas liquefaction plants. For piping systems above pressure class 2500, the requirements of chapter IX of ASME B31.3 shall be complied with, in addition to the requirements stated in this standard.

This document is applicable to all pressure retaining components and any non-pressure retaining component, such as a member of a pipe support, welded directly to a pressure retaining component.

This document is not applicable to the following:

- marine-related piping systems, e.g. ballasting piping systems, systems covered by classification societies;
- metallic tubing used for subsea umbilical systems;

NOTE 1 Reference can be made to [ISO 13628-5](https://standards.iteh.ai/catalog/standards/sist/538c56fa-849b-44fa-bb74-b2f14a7d0c1b/iso-13703-3-2023) or [API Spec 17E](https://standards.iteh.ai/catalog/standards/sist/538c56fa-849b-44fa-bb74-b2f14a7d0c1b/iso-13703-3-2023) for welding and examination of these components.

- piping systems with corrosion resistant cladding (either integrally clad or mechanically lined) or weld overlay, including buttering and associated dissimilar welds;

NOTE 2 Reference can be made to [DNV-RP-B204](https://standards.iteh.ai/catalog/standards/sist/538c56fa-849b-44fa-bb74-b2f14a7d0c1b/iso-13703-3-2023) for welding and examination of these systems.

- refractory alloys [with exception of CP titanium Grade 1 (UNS R50250) or Grade 2 (UNS R50400)];
- non-metallic piping assemblies;
- transportation pipeline systems, including flow-lines, designed in accordance with a recognized pipeline design code.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at <https://www.iso.org/obp>

— IEC Electropedia: available at <https://www.electropedia.org/>

3.1

alkaline service

service environments containing alkaline compounds such as amines, caustic, carbonates

3.2

bolted connection

connections with bolts, to allow assembly and disassembly, that uses flanges or clamps as connectors.

3.3

carbon equivalent

C_E

numerical value for a steel's composition that represents the contribution of the relevant elements to the hydrogen cracking susceptibility of steel

Note 1 to entry: The carbon equivalent is based on:

$$C_E = \%C + \left(\frac{\%Mn}{6} \right) + \left(\frac{\%Cr + \%Mo + \%V}{5} \right) + \left(\frac{\%Ni + \%Cu}{15} \right)$$

where all mass fractions are expressed in percent.

3.4

closure weld

final weld connecting piping systems, assemblies or sub-assemblies that have been successfully leak tested, but that itself is not subject to leak testing

Note 1 to entry: Closure welds include any welds made after leak or tightness testing, such as seal welds to threaded connections, or repair welds made in the event of a leak that are not subject to further leak test.

Note 2 to entry: Closure welds are often also referred to as 'golden welds'.

3.5

computerized imaging technique

CIT

manual or encoded ultrasonic examination technique with capability for computer processed display or analysis and display of ultrasonic data to provide two or three dimensional surfaces

3.6

confined space

space that is substantially but not necessarily entirely enclosed, and where serious injury can occur from hazardous substances or conditions within the space or nearby (e.g. lack of oxygen)

Note 1 to entry: Confined space includes access into the internal bore of pipes to install, inspect and remove internal backing gas dams, and during cleaning, flushing, leak and tightness testing activities.

3.7

cryogenic service

service environments with a minimum design temperature lower than $-104\text{ }^{\circ}\text{C}$

3.8

low-alloy steel

steel with significant alloy additions (e.g. Groups 4 to 6 according to ISO 15608, or P-No. 3 to P-No 5 and P-No. 15E according to ASME B31.3)

3.9

extrados

outer curved portion of a bend

3.10

fabricator

organization responsible for the fabrication, welding, examination and testing of piping systems including any externally provided products or services

Note 1 to entry: For the purposes of this document, "fabricator" is considered interchangeable with "manufacturer", "erector", "employer" or "purchaser" where these terms are used in referenced documents.

3.11

fibre elongation

elongation during bending or forming calculated as 100 r/R expressed as percentage

Note 1 to entry: Fibre elongation can be determined by physical measurement or calculation.

3.12

heat input

energy introduced into the weld region during welding per unit run length

Note 1 to entry: The reference for the calculation of heat input is ASME Boiler and Pressure Vessel Code, Section IX:2019 for the specific welding process.

3.13**high alloyed stainless steel**

austenitic stainless steel typically having $PREN \geq 40$ or $[\% Ni + 2 (\% Mo)] > 30$ where $\% Mo > 2$, where all mass fractions are expressed as percent

EXAMPLE SS type 6Mo or SS type 565.

3.14**intrados**

inner curved portion of a bend

3.15**leak testing**

application of a pressure load greater than the design load to demonstrate the integrity of a piping assembly to safely withstand the design load

Note 1 to entry: Leak testing is also referred to as “hydrostatic leak testing” or “pneumatic leak testing”, or combination thereof, as defined in ASME B31.3.

3.16**lot**

totality of welds completed by all welders, and accepted by visual examination on any one day, unless otherwise defined in the engineering design

[SOURCE: PFI ES48:2015]

3.17**low sulfur oil**

heating oil with maximum sulfur content of 1 000 ppm

3.18**nephelometric turbidity units****NTU**

measurement of water turbidity

3.19**owner**

person, partnership, organization or business ultimately responsible for design, construction, operation, and maintenance of a facility

3.20**pitting resistance equivalent number**

number indicating the resistance of stainless steels to pitting corrosion and related to chemical composition

Note 1 to entry: PREN is calculated from one of the following formulas:

$$PREN = \% Cr + 3,3 \% Mo + 16 \% N$$

$$PREN = \% Cr + 3,3 \% (Mo + 0,5 W) + 16 \% N$$

where all mass fractions are expressed as percent.

Note 2 to entry: All PREN limits are absolute limits based upon the heat analysis. The calculated value shall not be rounded.

3.21**sour service**

service environments that contain sufficient H_2S to cause cracking of materials

Note 1 to entry: For the purpose of the document, the mechanisms that result in cracking are addressed in ISO 15156-2 or ISO 15156-3.

Note 2 to entry: For the purpose of this document, ANSI/NACE MR0175 is equivalent to ISO 15156-2 and ISO 15156-3, respectively.

3.22

stainless steel 300-series

SS 300-series austenitic stainless steel with at least 16 % Cr (mass fraction) and 8 % Ni (mass fraction) possibly with other elements added to secure special properties

Note 1 to entry: Low carbon grades are typically used where welding is required.

EXAMPLE UNS S30400, UNS S30403, UNS S31600, UNS S31603.

3.23

stainless steel type 22Cr duplex

SS type 22Cr duplex

ferritic/austenitic stainless steel alloys with $30,0 < \text{PREN} < 40,0$ and $\text{Cr} \geq 19 \%$ (mass fraction)

EXAMPLE UNS S31803, UNS S32205.

3.24

stainless steel type 25Cr duplex

SS type 25Cr duplex

ferritic/austenitic stainless steel alloys with $40,0 \leq \text{PREN} < 48,0$

Note 1 to entry: This alloy is often referred to as “super duplex”.

EXAMPLE UNS S32505, UNS S32550, UNS S32750, UNS S32760, UNS S39274, UNS S39277.

3.25

stainless steel type 6Mo

SS type 6Mo

austenitic stainless steel with $\text{PREN} \geq 40$ and a nominal Mo alloying content of 6 % (mass fraction) and nickel alloys with Mo content in the range 6 % to 8 % (mass fraction)

EXAMPLE UNS S31254, UNS N08367, UNS N08926.

3.26

stainless steel type 565

SS type 565

manganese austenitic stainless steel with Mn content in the range 4 % to 12 % (mass fraction) and $\text{PREN} \geq 40$

EXAMPLE UNS S34565.

3.27

tangent

straight section at the end of a bend

3.28

tightness testing

application of a pressure differential to a piping assembly to detect leakage paths or rates

Note 1 to entry: Tightness testing includes testing of mechanically completed piping systems as part of pre-commissioning activities, and sensitive leak tests as defined in ASME B31.3.

3.29

transition zone

areas of the start and stop points of induction heating, which include material that extends from the unheated mother pipe to the material that has been heated to the full bending temperature

3.30

weave bead

weld bead formed using weaving. See also stringer bead.

3.31**weaving**

welding technique in which the energy source is oscillated transversely as it progresses along the weld path

3.32**weld zone**

grouping of weld passes with similar parameters and function, e.g. root, fill and cap

3.33**stringer bead**

weld bead formed without appreciable weaving

4 Abbreviated terms**4.1 Symbols**

D	nominal pipe diameter, expressed in millimetres
H_{BW}	heated band width, expressed in millimetres
h	Maximum misalignment at a butt weld seam
L	length, expressed in millimetres
R	nominal bending radius to centreline of pipe, expressed in millimetres
r	nominal outside radius of the pipe, expressed in millimetres
t	nominal material thickness at the weld, expressed in millimetres
U_g	Geometric unsharpness

4.2 Abbreviated terms

AUT	Automatic Ultrasonic Testing
AWS	American Welding Society
aMDEA	activated MDEA
CMTR	certified material test report
CP	commercially pure (in relation to titanium materials)
CRA	corrosion resistant alloy
CSWIP	certification scheme for weldment inspection personnel
CWEng	certified welding engineer
DGA	di-glycol amine
DIPA	di-iso propyl amine
ECA	engineering critical assessment
EEA	European economic area

ISO 13703-3:2023(E)

EWE	European welding engineer
EWf	European Welding Federation
FCAW-G	flux cored arc welding – gas shielded
FCAW-S	flux cored arc welding – self shielded
FMC/TFM	full matrix capture/total focussing method
FN	ferrite number
GMAW	gas metal arc welding
GMAW-S	gas metal arc welding – short circuiting mode of transfer
GTAW	gas tungsten arc welding
HAZ	heat affected zone
HBW	heated band width (of PWHT)
HIP	hot isostatic pressed
HRC	Rockwell C hardness number
HV	Vickers hardness number
IIW	International Institute of Welding
ITP	inspection and test plan
IWE	international welding engineer
MDEA	methyldiethanolamine
MDMT	minimum design metal temperature (synonymous with design minimum temperature as defined in ASME B31.3)
MEA	mono ethanolamine
MT	magnetic particle testing (for use on magnetic materials)
NDT	non-destructive testing
NTU	neophelometric turbidity units
OES	optical emission spectrometry
PAUT	phased array ultrasonic testing technique
PCN	Personal Certification for Non-Destructive Testing
PED	Pressure Equipment Directive (European Directive 2014/68/EU) see Annex D
PMI	positive materials identification
PREN	pitting resistance equivalent number
PT	liquid penetrant testing (for use on non-magnetic materials)
PQR	procedure qualification record

PWHT	post weld heat treatment
QL	quality level
QMS	quality management system
RT	radiographic testing
SAW	submerged arc welding
SMAW	shielded metal arc welding
SMYS	specified minimum yield stress
SS	stainless steel
SSC	sulphide stress cracking
SWPS	standard welding procedure specification
TOFD	time of flight diffraction
WPS	welding procedure specification
UNS	unified numbering system
UT	ultrasonic testing

5 Health, safety and quality requirements

5.1 Health and safety requirements

5.1.1 The fabricator shall at least provide the following safety equipment and systems:

- a) ventilation and extraction facilities for welding-related activities or work in a confined space;
- b) personal protective equipment including eye, breathing and hearing protection;
- c) access/scaffolding/working platforms and fall-arrest protective equipment for working at height;
- d) access and secure, temporary formwork for working below-grade;
- e) protective systems to prevent electric shock, build-up or discharge of static electricity, and earthing of welding current through susceptible components in the piping assembly;
- f) 'whip checks' on test hoses for flushing, cleaning, leak testing/tightness testing.

5.1.2 All work undertaken in a confined space shall be managed using a permit-to-work system.

NOTE 1 ISO 45001 specifies requirements for an occupational health and safety management system, and gives guidance for its use, to enable organizations to provide safe and healthy workplaces by preventing work-related injury and ill health, as well as by proactively improving its occupational health and safety performance. IOGP Report 423 describes a process by which clients can select suitable contractors, set out expectations and requirements, award contracts, and manage all the phases of the contracting process with a view to improving client and contractor management of health, safety and environmental risks for contracted activities.

Note 2 ANSI Z49.1 and ISO/TR/18786 give specific requirements and guidance on safety in Welding fabrication activities.
