This European Standard was approved by CEN on 16 October 2017 and includes Amendment approved by CEN on 8 April 2024.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the CEN-CENELEC Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the CEN-CENELEC Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and United Kingdom.

## EN 14325:2018+A1:2024 (E)

### European foreword

This document (EN 14325:2018+A1:2024) has been prepared by Technical Committee CEN/TC 162 “Protective clothing including hand and arm protection and lifejackets”, the secretariat of which is held by DIN.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by November 2024, and conflicting national standards shall be withdrawn at the latest by November 2024.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. CEN not be held responsible for identifying any or all such patent rights.

This document includes Amendment 1 approved by CEN on 8 April 2024.

This document supersedes A1 EN 14325:2018 A1.

The start and finish of text introduced or altered by amendment is indicated in the text by tags A1 A1.

A1 *deleted sentence* A1

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, Former Yugoslav Republic of Macedonia, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey and the United Kingdom.

<https://standards.iteh.ai/catalog/standards/sist/bf81b12f-33fa-4a15-88e1-9e9661648705/sist-en-14325-2018a1-2024>

## 1 Scope

This European Standard specifies the performance classification and test methods for materials used in chemical protective clothing, including gloves and footwear. The gloves and boots should have the same chemical protective barrier requirements as the fabric when an integral part of the clothing. This is a reference standard to which chemical protective clothing performance standards may refer in whole or in part, but this standard is not exhaustive in the sense that product standards may well require testing according to test method standards which are not included in this standard.

While these performance levels are intended to relate to the usage to which the chemical protective clothing is to be put, it is essential that the chemical protective clothing manufacturer or supplier indicate the intended use of the protective clothing and that the user (specifier) carries out a risk assessment in order to establish the correct performance level for the intended task.

## 2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

## EN 14325:2018+A1:2024 (E)

### 3 Terms and definitions

For the purposes of this document, the terms and definitions given in CEN ISO/TR 11610 and the following apply.

**3.1  
abrasion rub**  
one revolution of the outer drives of the Martindale abrasion tester

[SOURCE: EN ISO 12947-1:1998]

**3.2  
abrasion cycle**  
completion of all the translational abrasion movements tracing a Lissajous figure comprising 16 rubs, i.e. 16 revolutions of the two outer drives and 15 revolutions of the inner drive of the Martindale abrasion tester

[SOURCE: EN ISO 12947-1:1998]

**3.3  
material**  
one or several substances, in form of flexible planar structure, of which an item of clothing is made, excluding hardware and labels

**3.3.1  
single layer material**  
material consisting of only one layer

**3.3.2  
multilayer material**  
material consisting of several layers, which may be either permanently bonded together or intimately combined prior to the garment manufacturing stage, or which can be separated without any damage to each individual layer

Note 1 to entry: By “permanently bonded together” is meant for example by coating, laminating, gluing. By “intimately combined” is meant for example by weaving, quilting.

**3.3.3  
multilayer material consisting of separate layers**  
multilayer material, where individual layers that are neither permanently bonded together nor intimately combined, can be separated without any damage to the individual layers

### 3.4

#### specimen breakdown

in abrasion resistance or flex cracking resistance testing, the visually observed deterioration in a specimen after exposure to a specified number of abrasion rubs or cycles of flexing

#### EXAMPLE

- In woven fabrics, when two separate threads are completely broken;
- in knitted fabrics, when one thread is broken down;
- in pile fabrics, when the pile is fully worn off;
- in nonwovens, when the first hole resulting from the wear is of a diameter at least equal to 0,5 mm;
- in coated material, when coating surface has the first hole resulting from the wear of a diameter at least equal to 0,5 mm.

Note 1 to entry: The hole does not have to be through all materials for it to be a specimen breakdown.

[SOURCE: EN ISO 12947-2:2016]

## 4 Performance classification of materials

### 4.1 Determination of property value for performance classification

A number of performance classification levels are identified for the various properties of materials to be found in this standard.

The value of each property defined in 4.4 to 4.15 and which shall be used for performance classification, shall be determined in accordance with **Annex B** including the calculation of uncertainty of measurement for all the results.

If not specified otherwise within 4.4, 4.5, 4.6, 4.7, 4.9 or within the specific test method itself, a material with different behaviour in the length and cross directions, shall be tested for its performance in both directions. The performance classification shall be based on the results obtained for the direction resulting in the lower performance classification when evaluated according to **Annex B**.

For a material with different surface characteristics, the fabric side that will appear on the outside of the apparel shall be tested for all test methods that are linked to surface performance (i.e. 4.4, 4.5, 4.6, 4.8, 4.11, 4.12, 4.13, 4.14, 4.15,) and the performance classification shall be based on the results for this side.

If the chemical protective clothing consists of multiple layers of materials, with or without separable layers, all layers shall be tested together with the chemical protective clothing outer surface being tested for those properties which are linked to surface performance.

For materials, which require pre-treatment, the performance classification shall be based on the lowest performance classification obtained on either testing new (not pre-treated) and/or pre-treated materials based on evidence. The performance classification tests shall be performed on the worst case. If insufficient evidence is available to determine whether the test shall be performed as new or pre-treated, the test shall be performed in both conditions.

## EN 14325:2018+A1:2024 (E)

### 4.2 Pre-treatment

#### 4.2.1 Pre-treatment by cleaning and disinfection

Before each test, all chemical protective clothing material samples, with the exception of limited-use chemical protective clothing, shall undergo pre-treatment by cleaning and disinfection as applicable.

If the manufacturer's instructions indicate that cleaning or disinfection is not allowed, i.e. limited use garments, then testing shall be carried out on new material.

Where applicable according to manufacturer's instruction, the cleaning and disinfection shall be in line with the manufacturer's instructions, on the basis of standardized procedures. If the number of cleaning and disinfection cycles is not specified, the tests shall be carried out after 5 cycles of pre-treatment, each consisting of one wash cycle, one dry cycle and one disinfection cycle carried out in the sequence as indicated by the manufacturer's instructions. This shall be reflected in the information supplied by the manufacturer. If the garment can be washed or alternatively dry-cleaned it shall only be washed, dried and disinfected. If only dry-cleaning is allowed, the garment shall only be dry-cleaned and disinfected in accordance with the manufacturer's instructions.

#### 4.2.2 Pre-treatment by abrasion

Specimens, which have been pre-treated according to 4.2.1, may also be pre-treated by one of the numbers of abrasion rubs given in Table 1 in accordance with the method described in 4.4.1 and as specified in the product standard or as defined by the manufacturer, whichever is the larger, prior to testing according to 4.11.

#### 4.2.3 Pre-treatment by flexing

Specimens, which have been pre-treated according to 4.2.1, may also be pre-treated by one of the numbers of flexing cycles given in Table 2 in accordance with the method described in 4.5.1 and as specified in the product standard or as defined by the manufacturer, whichever is the larger, prior to testing according to 4.11.

### 4.3 Conditioning

Unless otherwise indicated in the product standard, all specimens shall be conditioned by storage at  $(20 \pm 2) ^\circ\text{C}$  and  $(65 \pm 5) \%$  relative humidity in accordance with EN ISO 139 for at least 24 h. If applicable, the tests shall be started within 5 min of removing the specimen from the conditioning atmosphere, unless otherwise indicated in the test method standard.

Conditioning may be omitted or aligned with the conditions of 4.3 if it can be shown that test results are not affected by the foreseeable changes of temperature and relative humidity.

### 4.4 Abrasion resistance

#### 4.4.1 General

A set of four test specimens of a material sample, where each specimen shall consist of all layers, shall be tested in accordance with EN ISO 12947-2 in the inverted mode, i.e. a test specimen of at least 140 mm diameter placed on the abradant table and an abradant of at least 30 mm diameter mounted in the test piece holder, using abrasive paper specified in Annex A  $\langle A_1 \rangle$  and with an applied downward pressure of 9 kPa. The abrasion resistance of the chemical protective clothing material shall be classified according to the levels of performance given in Table 1, using the highest number of abrasion rubs, determined according to 4.4.2, which do not cause damage to the material.

## 4.4.2 Determination of the highest number of abrasion rubs which does not cause damage to the material and which shall be used for the performance classification

### 4.4.2.1 General

To determine the level of performance, the leak tightness of each of the four test specimens of a material sample shall be determined after a number of abrasion rubs. An additional sample will be used to determine the leak tightness prior abrasion.

**A1** There are three methods of leak tightness assessment, the pressure pot, the hydrostatic head and visual inspection.

- The pressure pot shall be used for materials holding the pressure according to 4.4.2.2.
- The hydrostatic head shall be used for air permeable materials which cannot hold the pressure according to 4.4.2.2, but can be tested according to 4.4.2.3.

NOTE 1 When evidence is presented that air permeable materials cannot hold the pressure according to 4.4.2.2, this does not need to be re-confirmed.

- Visual inspection is permitted when the material does not permit either of the above quantitative assessment methods in this subclause to be performed. In this case, this shall be reported in the test report and also in the Instructions for Use indicating that the visual inspection is qualitative and does not provide evidence of liquid tightness after abrasion. If this assessment is performed through visual inspection, the maximum classification that can be claimed is a Class 3.

NOTE 2 When evidence is presented that neither of the above two quantitative assessment methods in this subclause can be performed due to the nature of the material, this does not need to be re-confirmed. **A1**
