

Designation: C1313/C1313M – 12

Standard Specification for Sheet Radiant Barriers for Building Construction Applications¹

This standard is issued under the fixed designation C1313/C1313M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reappraisal. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reappraisal.

1. Scope

1.1 This specification covers the general physical property requirements of radiant barrier materials for use in building construction. The scope is specifically limited to requirements for radiant barrier sheet materials that consist of at least one surface having a far-infrared emittance of 0.1 or less, such as metallic foils or metallic deposits mounted or unmounted on substrates.

1.2 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

1.3 The following safety hazard caveat pertains only to the test methods (Section 10) described in this specification. *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 *Definitions*—For definitions of terms used in this specification, refer to Terminology C168.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 *radiant barrier*—a low emittance (0.1 or less) surface used in the construction of a radiant barrier system.

3.2.2 *radiant barrier system (RBS)*—a building construction consisting of a radiant barrier bounded by an open air space.

3.2.3 *non-structural radiant barrier*—a radiant barrier material design that during manufacture is not bonded to a structural building material.

3.2.4 *structural radiant barrier*—a radiant barrier material design that during manufacture is bonded (leaving no air space between the radiant barrier and the bonding substrate) to a structural building material such as plywood or oriented strand board (OSB).

4. Ordering Information

4.1 Prior to purchase, for sampling and acceptance procedures, Practice **C390** is an option when agreed to by purchaser and manufacturer.

4.2 Specify the width and total area to be installed.

4.3 Specify any special markings.

5. Materials and Manufacture

5.1 Sheet radiant barrier materials shall consist of low emittance surface(s) that are in combination with any substrates and adhesives required to meet the specified physical material properties.

6. Workmanship, Finish, and Appearance

6.1 Sheet radiant barriers shall be manufactured, packaged and shipped in such a manner that, when received by the customer, they are suitable for installation in accordance with either Practice **C1743** or **C1744**.

7. Physical Requirements

7.1 The low-emittance materials shall conform to the physical properties as specified in **Table 1** and local building codes.

7.2 The following physical characteristics of sheet radiant barriers are important:

7.2.1 *Surface Emittance*—Radiant barriers derive effectiveness from a low-emittance surface. The surface emittance of sheet radiant barriers shall be determined in accordance with Test Method **C1371**.

7.2.2 *Water Vapor Transmission*—Sheet radiant barriers are manufactured as vapor retarders or vapor transmitting materials. A radiant barrier that is to serve as a vapor retarder shall not have a permeance greater than one perm, as determined in accordance with Test Methods **E96/E96M** (Procedure A—Desiccant Method).

7.2.2.1 A vapor transmitting radiant barrier shall have a permeance greater than five perms as determined with Test Methods **E96/E96M** (Procedure A—Desiccant Method).

7.2.3 *Surface Burning Characteristics*—Determine in accordance with **10.3**.

7.2.4 *Corrosivity*—Sheet radiant barriers shall be tested for corrosion resistance in accordance with Test Method **D3310**. Evidence of significant corrosion shall be cause for rejection. A corrosion test that results in less than 2 % affected surface is satisfactory.

7.2.5 *Tear Resistance*—Sheet radiant barriers shall be tested for tear resistance using Test Method **D2261**. The tear resistance shall be included in the manufacturer's technical data.

7.2.6 *Adhesive Performance*:

7.2.6.1 *Bleeding*—Adhesives, when used in bonding, shall show no sign of bleeding when tested in accordance with the test procedure in **10.1**. Bleeding at cut edges shall be disregarded. The total of bleeding or delamination, covering more than 2 % of the sample area, shall be cause for rejection.

7.2.6.2 *Pliability*—Specimens tested in accordance with the test procedure in **10.2** shall not show cracking or delamination. This test does not apply to materials that are not flexible and not intended to be bent or flexed.

7.2.7 *Mold and Mildew*—Fungal resistance of sheet radiant barriers shall be tested in accordance with Test Method **C1338**. The samples are then examined visually under 5× magnification for the extent of mold growth and for indications of deterioration. Evidence of mold growth beyond the inoculation area shall be cause for rejection.

8. Significance and Use

8.1 This specification recognizes that the effectiveness of a sheet radiant barrier is dependent on proper installation. Practices **C1743** and **C1744** address use and installation of radiant barriers.

8.2 This specification identifies the material properties that are important for sheet radiant barrier products. When appropriate, values for the properties have been stated.

8.3 When specific material properties are required for a particular application the user shall consult the manufacturer.

8.4 Radiant barriers shall be free of dust or other contaminants to remain effective.

9. Sampling

9.1 Sampling shall be performed in accordance with Practice **C390**.

10. Test Methods for Adhesive Performance

10.1 *Bleeding and Delamination*:

10.1.1 *Scope*—This test method covers the determination of bleeding and delamination of sheet radiant barriers.

10.1.2 *Significance and Use*—It is necessary that sheet radiant barriers not show adhesive bleeding or delamination. These conditions contribute to a loss of structural integrity, a change in water vapor permeability, or an increase in surface emittance.

10.1.3 *Sampling*—A minimum of three specimens of the radiant barrier material with dimensions of approximately 7.6 by 15.2 cm [3 by 6 in.] will be tested. The test specimens shall be cut from separate locations on the roll or panel of the radiant barrier material.

10.1.4 *Procedure*—Suspend specimens vertically in an oven and heat to a temperature of 82 ± 3°C [180 ± 5°F] for 5 h.

10.1.4.1 Determine under 5× magnification the following: has the adhesive bled or extruded through the surface or has any separation of foil from the substrate (delamination) occurred. Estimate the percentage of the area that has delaminated.

TABLE 1 Physical Properties of Low Emittance Materials

Foils or Deposits
Purity—at least 99 % aluminum (where applicable)
Emittance—0.1 or less
Corrosivity—Test Method D3310 result <2.0 %
Bleeding or delamination—<2.0 %
Pliability—no cracking or delamination
Mold and mildew—growth or delamination outside inoculation area is cause for rejection

^AManufacturer's tolerances.
