Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iso.org/directives<

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents) or the IEC list of patent declarations received (see patents.iec.ch).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, www.iso.org/iso/foreword.html. In the IEC, www.iec.ch/understanding-standards.

This document was prepared by ITU-T [Telecommunication Standardization Sector of ITU] (as ITU-T X.894 [10/2018]) and drafted in accordance with its editorial rules, in collaboration with Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 6, *Telecommunications and information exchange between systems*.

A list of all parts in the ISO/IEC 24824 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

INTERNATIONAL STANDARD ISO/IEC 24824-4 RECOMMENDATION ITU-T X.894

Information technology — Generic applications of ASN.1 —

Part 4:

Cryptographic message syntax

1 Scope

This Recommendation | International Standard enhances the existing cryptographic message syntax (CMS) protocol by adding signcryption techniques and providing a new Abstract Syntax Notation One (ASN.1) module which conforms to the latest edition of the ASN.1 standard which can be used with all standardized encoding rules of ASN.1.

2 Normative references

The following Recommendations and International Standards contain provisions which, through reference in this text, constitute provisions of this Recommendation | International Standard. At the time of publication, the editions indicated were valid. All Recommendations and Standards are subject to revision, and parties to agreements based on this Recommendation | International Standard are encouraged to investigate the possibility of applying the most recent edition of the Recommendations and Standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards. The Telecommunication Standardization Bureau of the ITU maintains a list of currently valid ITU-T Recommendations.

2.1 Identical Recommendations | International Standards

- Recommendation ITU-T X.509 (2016) | ISO/IEC 9594-8:2017, Information technology - Open Systems Interconnection - The Directory: Public-key and attribute certificate frameworks.

2.2 Paired Recommendations | International Standards equivalent in technical content

None.

2.3 Additional References

3 Definitions

For the purposes of this Recommendation | International Standard, the following definitions apply:

The following terms are defined in Rec. ITU-T X.509 | ISO/IEC 9594-8:

- a) attribute certificate;
- b) CA certificate;
- c) certificate revocation list.

The following term is defined in ISO/IEC 29150:

- signcryption

4 Abbreviations

For the purposes of this Recommendation | International Standard, the following abbreviations apply:

6 Cryptographic message syntax

CMS is defined in the base text, IETF RFC 5652. ASN.1 modules have been revised to conform to the current ASN.1 standard in IETF RFC 6268.

CMS defines the following content types:

- data: used to transfer data defined string of octets;
- signed data: used to transfer data with zero or more signatures;
- enveloped data: used to transfer encrypted data with one or more content-encryption keys;
- digested data: used to transfer data with a message digest;
- encrypted data: used to transfer encrypted data;
- authenticated data: used to transfer data with a message authentication code and one or more encrypted authentication keys.

Each of these content types is uniquely identified by an object identifier:

for data:

```
id-data OBJECT IDENTIFIER ::= {iso(1) member-body(2) us(840)
    rsadsi(113549)pkcs(1) pkcs7(7) 1}
```

for signed data:

```
id-signedData OBJECT IDENTIFIER ::= {iso(1) member-body(2)
    us(840)rsadsi(113549) pkcs(1) pkcs7(7) 2}
```

for enveloped data:

```
id-envelopedData OBJECT IDENTIFIER ::= {iso(1) member-body(2) us(840)
              rsadsi(113549) pkcs(1) pkcs7(7) 3}
          for digested data:
          id-digestedData OBJECT IDENTIFIER ::= {iso(1) member-body(2) us(840)
              rsadsi(113549) pkcs(1) pkcs7(7) 5}
          for encrypted data:
          id-encryptedData OBJECT IDENTIFIER ::= {iso(1) member-body(2) us(840)
              rsadsi(113549) pkcs(1) pkcs7(7) 6}
          for authenticated data:
          id-ct-authData OBJECT IDENTIFIER ::= {iso(1) member-body(2) us(840)
              rsadsi(113549) pkcs(1) pkcs-9(9) smime(16) ct(1) 2}
Data transferred with CMS use the following ASN.1 type:
ContentInfo ::= SEQUENCE {
              contentType
                               CONTENT-TYPE.&id({ContentSet}),
              content [0] EXPLICIT CONTENT-
              TYPE.&Type({ContentSet}{@contentType})}
The CONTENT-TYPE information object class is defined as TYPE-IDENTIFIER and is used to assign one of the previous
object identifiers to the corresponding ASN.1 type.
CONTENT-TYPE ::= TYPE-IDENTIFIER
ContentType ::= CONTENT-TYPE.&id
ContentSet CONTENT-TYPE ::= {
              -- Define the set of content types to be recognized
              ct-Data
                         TIEN Standarus
              ct-SignedData
              ct-EnvelopedData (121102 rg Sife n 21)
              ct-DigestedData |
              ct-EncryptedData
                                     ht Preview
              ct-AuthenticatedData,
              ...}
ct-Data
                              CONTENT-TYPE ::= {OCTET STRING IDENTIFIED BY id-
                              data}
ct-SignedData catalog/standards/iso
                                 CONTENT-TYPE ::= {SignedData IDENTIFIED BY id-
                                   signedData}
                             CONTENT-TYPE ::= {EnvelopedData IDENTIFIED BY
ct-EnvelopedData
                               id-envelopedData}
                                   CONTENT-TYPE ::= {DigestedData IDENTIFIED BY
ct-DigestedData
                               id-digestedData}
                              CONTENT-TYPE ::= {EncryptedData IDENTIFIED BY
ct-EncryptedData
                               id-encryptedData}
                              CONTENT-TYPE ::= {AuthenticatedData IDENTIFIED BY
ct-AuthenticatedData
                               id-ct-authData}
```

Other content types can be defined by creation of new information objects of **CONTENT-TYPE** information object class using unique object identifiers.

The ct-SignedCryptedData defined in clause 7 is an example.

7 Signcryption

The SigncryptedData uses the signcryption technique defined in ISO/IEC 29150. The signcryption technique simultaneously signs and encrypts the data to achieve origin authentication, data integrity and confidentiality. Signcryption can be used in CMS in four different modes:

- a) signcrypted-content: content of any type or format is signcrypted using the signcryption algorithm;
- b) **signcrypted-attributes**: content of any type or format and a collection of attributes of any type or format are together signcrypted;
- c) signcrypted-components: elements of content of any type or format are signcrypted for one or more message recipients using the public-private keys of the sender and the public key of each recipient.

d) **signcrypted-envelope**: a fresh symmetric key is used to encrypt content of any type or format and the resulting ciphertext is transmitted as an octet string.

7.1 The SigncryptedData type

```
id-signcryptedData
                        OBJECT IDENTIFIER ::=
             {itu-t
                     recommendation (0) x (24)
                                                cms-profile(894) signcryption(1)
             data(0)}
ct-SigncryptedData
                        CONTENT-TYPE ::= {
             TYPE SigncryptedData IDENTIFIED BY id-signcryptedData}
SigncryptedData
                   ::= SEQUENCE {
                              CMSVersion,
             version
             contentInformation
                                    ContentInformation,
             certificates
                              CertificateSet OPTIONAL,
                              RevocationInfoChoices OPTIONAL,
             crls
             signcrypters
                              Signcrypters
Signcrypters
              ::= SEQUENCE SIZE(1..MAX) OF Signcrypter
```

- a) version is version number.
- b) contentInformation identifies the signcrypted data processing mode.
- c) **certificates** is a collection of public key or attribute certificates to facilitate the validation of the public keys of the signcrypters. This collection may contain more certificates than necessary or fewer and, in the latter case, recipients have to use other means to get other certificates.
- d) crls is a collection of public key or attribute certificate revocation lists (CRLs) to facilitate the validation of the certificates of the signcrypters. As for certificates, this collection may contain more CRLs than necessary or fewer and, in the latter case, recipients have to use other means to get other CRLs.
- e) signcrypters is a collection of all signcrypter specific information.

7.2 The ContentInformation type

The modes are defined using the following information object class:

Four modes are currently defined:

- a) signcryptedAttributes: content and attributes of any type or format are signcrypted.
- b) **signcryptedComponents**: specified components of content of any type or format are signcrypted, and the resulting cryptogram is signed along with a manifest of signcrypted locations and other attributes.
- c) signcryptedContent: content of any type or format is signcrypted.
- d) **signcryptedEnveloped**: content of any type or format is encrypted under a symmetric key to create ciphertext for sharing with one or more message recipients. That symmetric key and a message digest of the ciphertext are signcrypted for each message recipient using the public-private keys of the sender and the public key of each recipient.

7.2.1 The signcryptedContent mode

In the signcrypted-content mode, content of any type or format is signcrypted using the signcryption algorithm identified in the signcryptedDataAlgorithm component of the signcrypters component of type SigncryptedData. The message sender applies this signcryption algorithm to the content using the sender public and private keys and the recipient public key. These keys are identified in the message as values of type SigncrypterIDs and the signcrytionValue component of type Signcrypter contains the results of signcryption.

In this processing mode of **SigncryptedData**, there are no signcrypted attributes and the optional **signatureInformation** component is not present. The message sender at their option may include values in the **unsigncryptedAttributes** component of the **Signcrypter** component for any recipient. The signcrypted-content mode is indicated in a message by the following information object identifier:

```
signcryptedContent MODE ::= { ID signcrypted-content }
```

A value of type **SigncryptedData** using signcrypted-content mode is created as follows:

- a) the value of the **version** component of type **SigncryptedData** is set to 1;
- b) in the **contentInformation** component of type **SigncryptedData**, set the value of mode to the signcrypted-content object identifier. the optional **content** component should not be present;
- c) optionally, include values in the certificates component of type SigncryptedData;
- d) optionally, include values in the crls component of type SigncryptedData;
- e) for each message recipient, include a value of type **Signcrypter** in the **signcrypters** component of type **SigncryptedData** as follows:
 - i) the value of the **version** component of type **Signcrypter** is set to 1,
 - ii) in the sids component of type Signcrypter set the components of a value of type SigncrypterIDs to identify the public-private key pairs of the message sender and recipient,
 - iii) set the value of the **signcryptedDataAlgorithm** component of type **Signcrypter** to identify the signcryption algorithm and any associated parameters,
 - iv) include the results of **signcrypting** content of any type or format encoded as a value of type OCTET STRING in the **signcryptionValue** component of type **Signcrypter**,
 - v) the optional signatureInformation component of type Signcrypter should not be present;
 - vi) optionally, include values in the unsigncryptedAttributes component of type Signcrypter.

To recover the plaintext from the SigncryptedData message, a message recipient should perform the following steps:

- search the list of per recipient values of type Signcrypter in the signcrypters component of type SigncryptedData to locate the recipient public-private key pair in the sids component of type Signcrypter;
- 2) designcrypt the value in the signcryptionValue component of type Signcrypter for a given recipient using their public-private key pair of the recipient and the public key of the sender identified in the sids component of type Signcrypter, and the signcryption algorithm and associated parameters provided in the signcryptedDataAlgorithm component of type Signcrypter.

Perform certificate path validation to gain assurance that the sender public key certificate is trusted.

7.2.2 The signcryptedAttributes mode

In the signcrypted-attributes mode, content of any type or format and a collection of attributes of any type or format in the **signcryptionAttributes** component of type **SigncrypterInfo** are together signcrypted as specified for the signcrypted-content mode. At least three attributes shall be present: the messageDigest, the **contentType**, and the **signcryptedAttributes** attribute.

1. 44... . . //

The signcrypted-attributes mode is indicated in a message by the following information object identifier:

```
signcryptedAttributes MODE ::= { ID signcrypted-attributes }
```

A value of type **SigncryptedData** using signcrypted-attributes mode is created as follows:

- a) the value of the **version** component of type **SigncryptedData** is set to 1;
- b) in the **contentInformation** component of type **SigncryptedData**, set the value of mode to the **signcrypted-attributes** object identifier. the optional **content** component should not be present;
- c) optionally, include values in the certificates component of type SigncryptedData;
- d) optionally, include values in the crls component of type SigncryptedData;
- e) for each message recipient, include a value of type **Signcrypter** in the **signcrypters** component of type **SigncryptedData** as follows:
 - i) the value of the **version** component of type **Signcrypter** is set to 1;
 - ii) in the sids component of type Signcrypter set the components of a value of type SigncrypterIDs to indentify the public-private key pairs of the message sender and recipient;
 - iii) set the value of the **signcryptedDataAlgorithm** component of type **Signcrypter** to identify the signcryption algorithm and any associated parameters;
 - iv) create a value of type **ToBeSigncrypted** by setting its **content** component to a value of type **Content** and its **attributes** component to a value of type **SigncryptedAttributes**;
 - v) signcrypt an encoded value of type **ToBeSigncrypted** and include the results of the processing in the **signcryptionValue** component of type **Signcrypter**;
 - vi) the optional **signatureInformation** component of type **SigncrypterInfo** should not be present;
 - vii) optionally, include values in the unsigncryptedAttributes component of type Signcrypter.

To recover the plaintext from the SigncryptedData message, a message recipient should perform the following steps:

- a) search the list of per recipient values of type **Signcrypter** in the **signcrypters** component of type **SigncryptedData** to locate the recipient public-private key pair in the **sids** component of type **Signcrypter**;
- b) designcrypt the value in the **signcryptionValue** component of type **Signcrypter** for the recipient using the signcryption algorithm and any associated parameters provided in the **signcryptedDataAlgorithm** component of type **Signcrypter** to recover a value of type **ToBeSigncrypted**;
- c) perform certificate path validation to gain assurance that the sender public key certificate is trusted.

7.2.3 The signcryptedComponents mode

In signcrypted-components mode, elements of content of any type or format are signcrypted for one or more message recipients using the public-private keys of the sender and the public key of each recipient. A content-type specific manifest of signcrypted element locations in the content is bound to the partially signcrypted content under a digital signature.

The signcrypted-components mode is indicated in a message by the following information object identifier:

```
signcryptedComponents MODE ::= { ID signcrypted-components }
```

A value of type SigncryptedPartsManifest is defined in terms of the &id and &Type fields of the SIGNCRYPTED information object class. This type definition uses a parametrized type, Signcrypted{}, whose sole parameter is the Manifest information object set:

The type of manifest required to identify the signcrypted components of a particular object varies with the type, structure and format of the object. For content in the form of an image, a **signcrypted** components manifest might be composed of a list of ((x, y), (x, y)) coordinate pairs that define a rectangular area of the image to be signcrypted and thereby redacted.

In this Recommendation | International Standard, a single manifest object is defined to support component identification in an extensible markup language (XML) document. The **xPathManifest** object uses location paths based on the XPath query language to specify a set of one or more signcrypted XML document components and is defined as follows:

```
xPathManifest SIGNCRYPTED ::= {
          OID id-cms-XPath PARMS XPathSet
     }

XPathSet ::= SEQUENCE SIZE(1..MAX) OF XPath

XPath ::= UTF8String (CONSTRAINED BY { -- XML Path Query Language 2.0 -- })
```

A value of type **SigncryptedData** using signcrypted-components mode is created as follows:

- a) the value of the **version** component of type **SigncryptedData** is set to 1;
- b) in the **contentInformation** component of type **SigncryptedData**, set the value of **mode** to the signcrypted-components object identifier. the optional **content** component should not be present;
- optionally, include values in the certificates component of type SigncryptedData;
- d) optionally, include values in the crls component of type SigncryptedData;
- e) for each message recipient, include a value of type **Signcrypter** in the **signcrypters** component of type **SigncryptedData** as follows:
 - the value of the **version** component of type **Signcrypter** is set to 1,
 - ii) in the **sids** component of type **Signcrypter** set the components of a value of type **SigncrypterIDs** to identify the public-private key pairs of the message sender and recipient,
 - iii) signcrypt one or more elements of the content and include the partially signcrypted results as the value of the signcryptionValue component of type Signcrypter
 - iv) in the **signatureInformation** component of type **Signcrypter**, identify the signing key in the optional **signerIdentifier** component if this key differs from the key used to signcrypt,
 - v) if the signature algorithm is not a system default or is not indicated in the signcrypted data algorithm ID, identify the signature algorithm object identifier and any associated parameters in the signatureAlgorithm component of type Signcrypter,
 - vi) prepare a manifest value in the **signcryptedPartsManifest** component of type **ToBeSigned** that indicates the location of each signcrypted element in the **signcryptionValue** component of type **Signcrypter**,
 - vii) include the **contentType** and **messageDigest** attributes in the **signedAttributes** component of type **ToBeSigned**,
 - viii) place the results of signing a value of type **ToBeSigned** in the **signatureValue** component of type **SignatureInformation**,
 - ix) optionally, include values in the unsigncryptedAttributes component of type Signcrypter.

https://standards.

To recover the plaintext from the **SigncryptedData** message, a message recipient should perform the following steps for each message recipient:

- a) search the list of per recipient values of type Signcrypter in the signcrypters component of type
 SigncryptedData to locate the recipient public-private key pair in the sids component of type
 Signcrypter;
- b) in the signatureInformation component of type Signcrypter, verify the signature in the signatureValue component over a value of type ToBeSigned using the signcryption algorithm and any associated parameters provided in the signcryptedDataAlgorithm component of type Signcrypter;
- using the manifest in the signcryptedPartsManifest component of type ToBeSigned, designcrypt each of the indicated signcrypted elements listed in the manifest to recover the partially signcrypted components of the content;
- d) perform certificate path validation to gain assurance that the sender certificates are trusted.

7.2.4 The signcryptedEnvelope mode

In the signcrypted-envelope mode, a fresh symmetric key is used to encrypt content of any type or format, and the resulting ciphertext is placed in the **encryptedContentInfo** component of a value of type **NamedKeyEncryptedData**, a type defined in ANSI X9.73-2017 that may include an optional key name and optional extensions.

```
NamedKeyEncryptedData ::= SEQUENCE {
                                    CMSVersion,
             Version
                                    [0] OCTET STRING OPTIONAL,
             keyName
             encryptedContentInfo
                                    EncryptedContentInfo,
             unprotectedAttrs
                                    [1] UnprotectedEncAttributes OPTIONAL
The EncryptedContentInfo type is defined in CMS protocol as:
EncryptedContentInfo ::=
             EncryptedContentInfoType { ContentEncryptionAlgorithmIdentifier }
EncryptedContentInfoType { AlgorithmIdentifierType } ::= SEQUENCE {
                                          CONTENT-TYPE.&id({ContentSet}),
             contentType
             contentEncryptionAlgorithm
                                          AlgorithmIdentifierType,
https://standards.encryptedContentards/iso/568c00[0] IMPLICIT OCTET STRING OPTIONAL } 24-4-2021
```

The encryptedContentInfo component of NamedKeyEncryptedData type also contains the required algorithm object identifier and any associated parameters of the symmetric encryption algorithm used to encrypt the content. This prepared value of type NamedKeyEncryptedData is then encoded as an OCTET STRING and placed in the content component of the contentInfo component of type SigncryptedData. The contentType component of type EncryptedContentInfo is set to the information object identifier value signcrypted-envelope.

The SigncryptedData message contains one value of type Signcrypter for each message recipient. The Signcrypter type contains a signcryptionAttributes component that must contain the symmetric encryption key signcrypted for each message recipient in a signcryptedEnvelope attribute.

The **signcryptedEnvelope** attribute is defined as follows:

When the signcryptedEnvelope attribute is included in the signcryptionAttributes component of type Signcrypter, both the messageDigest and contentType attributes shall be present. To complete construction of the message, the eContent is concatenated together with all signcryptionAttributes and signed by the message sender. The completed message can then be transmitted to all recipients.

On receiving the message, a recipient first verifies the signature on the message. To recover the payload encrypted in the signcryptedEnvelope attribute, a message recipient must first designcrypt the content in the value of type EncapsulatedContentInfo to recover the symmetric key, then use the recovered key to decrypt the payload.

A value of type SigncryptedData using signcrypted-envelope mode is created as follows:

- a) the value of the version component of type SigncryptedData is set to 1;
- b) in the contentInformation component of type SigncryptedData, set the value of mode to the signcrypted-envelope object identifier.
- c) using a fresh symmetric key, encrypt content of any type or format and place the encrypted content in the optional encryptedContentInfo component of a value of type NamedKeyEncryptedData;
- d) complete preparation of a value of type NamedKeyEncryptedData, by optionally providing a name for the symmetric key in the keyName component, and identifying the symmetric content encryption algorithm and any parameters in the encryptedContent component;
- e) embed the prepared value of type NamedKeyEncryptedData in the optional content component in the contentInformation component of type SigncryptedData;
- f) prepare a messageDigest attribute that identifies a message digest algorithm and contains a digest of the encryptedContent component of type NamedKeyEncryptedData;
- g) prepare a value of type ToBeSigncrypted that includes this messageDigest attribute in the attributes component, and the symmetric content encryption key (CEK) in the contents component, a value of type ToBeSigncrypted that will be signcrypted for each message recipient;
- h) optionally, include values in the certificates component of type SigncryptedData;
- i) optionally, include values in the crls component of type SigncryptedData;
- j) for each message recipient, include a value of type Signcrypter in the signcrypters component of type SigncryptedData as follows:
 - i) the value of the version component of type Signcrypter is set to 1,
 - ii) in the sids component of type Signcrypter set the components of a value of type SigncrypterIDs to identify the public-private key pairs of the message sender and recipient,
 - iii) set the value of the **signcryptedDataAlgorithm** component of type **Signcrypter** to identify the signcryption algorithm and any associated parameters,
 - iv) include the results of signcrypting the prepared value of type ToBeSigncrypted in the signcryptionValue component of type Signcrypter,
 - v) the optional signatureInformation component of type Signarypter should not be present,

vi) Optionally, include values in the unsigncryptionAttributes component of type Signcrypter.

To recover the plaintext from the SigncryptedData message, a message recipient should perform the following steps:

- a) search the list of per recipient values of type Signcrypter in the signcrypters component of type SigncryptedData to locate the recipient public-private key pair in the sids component of type Signcrypter;
- b) decode the optional content component in the contentInformation component of type SigncryptedData, to recover a value of type NamedKeyEncryptedData from the octet string;
- c) designcrypt the value in the **signcryptionValue** component of type **Signcrypter** for a given recipient using their public-private key pair of the recipient and the public key of the sender to recover the signcrypted value of type **ToBeSigncrypted** that contains a symmetric key and a message digest of the content encypted using the symmetric key;
- d) perform certificate path validation to gain assurance that the sender public key certificate is trusted;
- verify that the symmetric key encrypted content has not been modified by computing a digest of the encryptedContentInfo component of type NamedKeyEncryptedData. using the algorithm in the message digest attribute recovered from the signcrypted value of type ToBeSigncrypted and comparing the two digests for equivalency;
- f) use the symmetric key recovered from designcrypting the value of type ToBeSigncrypted to decrypt the content value of the contentInformation component of type SigncryptedData.

7.3 The Signcrypter type

The public-private key pairs of the message sender and recipient are identified as they are in the SigncryptedData message as values of type SigncrypterIDs defined as follows:

KeyPairIdentifier ::= SignerIdentifier

A message sender uses their own public and private keys along with the public key of the recipient to signcrypt content. The message recipient uses the public key of the sender with their own public and private keys to designcrypt the content signcrypted by the sender.

The **SigncryptedDataAlgorithmIdentifier** type contains the signcryption algorithm ID and any associated parameters. For all of the signcryption algorithms specified in ISO/IEC 29150, the parameters include one of the hash functions and one of the key derivation functions (KDFs) specified in ISO/IEC 18033-2.

```
SigncryptedDataAlgorithmIdentifier ::=

AlgorithmIdentifier {{SigncryptAlgorithms}}

SigncryptAlgorithms ALGORITHM ::= {

SigncryptionMechanism, -- ISO/IEC 29150 Signcryption algorithms --

... -- Expect additional algorithm objects --
}
```

A signcryptionValue component of type Signcrypter contains the results of signcryption, and is defined as follows:

```
SigncryptionValue ::= OCTET STRING (SIZE(1..MAX)) 4901-9dd0-a989cf6ac54e/iso-iec-24824-4-2021
```

An optional signatureInformation component of type Signcrypter contains information needed to support the use of a digital signature when the signcrypted-components mode of processing is used. The definition of type signatureInformation is provided in the detailed processing description that follows.

```
SignatureInformation ::= SEQUENCE {
                                    SignerIdentifier OPTIONAL,
             signerIdentifier
                                          SignatureAlgorithmIdentifier OPTIONAL,
             signatureAlgorithm
             toBeSigned
                                    ToBeSigned,
             signatureValue
                                    SignatureValue
ToBeSigned ::= SEQUENCE {
             signcryptedPartsManifest
                                          SigncryptedPartsManifest,
             signedAttributes
                                   SignedAttributes
SigncryptedPartsManifest ::= Signcrypted{{Manifest}}
Manifest SIGNCRYPTED ::= {
             xPathManifest,
             ... -- Expect additional manifest types --
             }
xPathManifest SIGNCRYPTED ::= {
             OID xPath PARMS XPathSet
XPathSet ::= SEQUENCE (SIZE(1..MAX)) OF XPath
```
