Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 107, *Metallic and other inorganic coatings*, Subcommittee SC 9, *Physical vapor deposition coatings*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

A hydrophobic surface is defined as a solid surface with a water contact angle higher than 90°. A hydrophobic surface tends to repel water droplets. Hydrophobic coatings have drawn much interest in electronic devices, aerospace engineering and construction industries. This is because of their self-cleaning, anti-icing and corrosion resistance properties. Among current hydrophobic coatings, polymer-based materials are the most commonly used due to their low surface energy. However, they are relatively soft with low durability when applied in harsh environments.

Metal-based hydrophobic physical vapor deposition (PVD) coating is a promising candidate for realizing the practical use of hydrophobic surfaces due to their outstanding mechanical durability. However, the surface wettability of metallic PVD coatings goes through a time evolution under ambient air exposure due to the adsorption of hydrocarbons. This makes it difficult to evaluate the wettability and apply this kind of coating for hydrophobic use. It is thus essential to evaluate how wettable metallic hydrophobic PVD coatings are for the further development and applications of metallic hydrophobic PVD coatings.
