Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had/had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents.www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 85, Nuclear energy, nuclear technologies, and radiological protection, Subcommittee SC 6, Reactor technology.

A list of all parts in the ISO 4917 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at <u>www.iso.org/members.html</u>.

ISO/FDIS 4917-1:2023(E)

Introduction

In accordance with IAEA Safety Standards Series No. SSR-2/1, protective measures against seismic events are required, provided earthquakes must be taken into consideration.

Earthquakes comprise that group of design basis<u>external</u> events that requires taking preventive plant engineering measures against damage and which are relevant with respect to radiological effects on the environment.

This document will be applied under the presumption that the geology and tectonics of the plant site have been investigated with special emphasis on the existence of active geological faults and lasting geological ground displacements, and that the site has been deemed suitable for a nuclear installation.

ISO/FDIS 4917-

ISO/FDIS 4917-1:2023(E)	Formatted: Font: Bold, English (United Kingdom)
	Formatted: Space After: 0 pt, Tab stops: Not at 17 cm
3.1 Action impact of an external force (e.g. seismic action)	Formatted: Adjust space between Latin and Asian text, Adjust space between Asian text and numbers
3.2 action effect internal force inside a structure (e.g. force, moment)	
3.3 active geological fault fault showing evidence of past movements (e.g. recent seismicity or geological evidence) within such a period that it is reasonable to assume that further movements can occur	
Note-1-to entry: For areas of low seismicity evidence of last movements in the quaternary (until $\approx 2,6 \cdot 10^6$ a) or -including Pliocene (until $\approx 5,3 \cdot 10^6$ a) maycan be appropriate to consider. For higher seismic areas shorter periods maycan be considered.	Formatted: Adjust space between Latin and Asian text, Adjust space between Asian text and numbers, Tab stops: Not at 0.7 cm + 1.4 cm + 2.1 cm + 2.8 cm + 3.5 cm + 4.2 cm + 4.9 cm + 5.6 cm + 6.3 cm + 7 cm
Note-2-to entry: A geological fault need also to be considered active if a structural relationship with a known active geological fault is demonstrated or likely. In this case the movement of one fault maycan cause the movement of the other.	
Note3to entry:_The definition is equivalent to "capable fault" in IAEA Glossary (2018).
