Foreword

ISO (the International Organization for Standardization) ~~is a~~ and IEC (the International Electrotechnical Commission) ~~form the specialized system for worldwide federation of national standards standardization. National bodies (that are members of ISO member bodies). The work or IEC participate in the development of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. Internationally by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.~~

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ~~ISO documents~~ document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 ~~(see www.iso.org/directives_2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs)).~~

~~Attention is drawn~~ ISO and IEC draw attention to the possibility that ~~some of the elements~~ implementation of this document may ~~be involve~~ the ~~subject~~ use of (a) patent ~~rights~~. ISO(s) and IEC take no position ~~concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and <https://patents.iec.ch>. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).~~

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), ~~see www.iso.org/iso/foreword.html~~ see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC-1, ~~Information and Communications Technology~~ technology, Subcommittee SC-24, ~~Computer graphics, image processing and environmental data representation~~.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html ~~www.iso.org/members.html~~ and www.iec.ch/national-committees.

Introduction

Developers and users of a smart city need tools to evaluate and examine options and trade-offs and predict outcomes. Parts or all of a smart city may need to be modelled, and smart city functions need to be simulated to evaluate possible outcomes. The modelling and simulation of smart city functions and processes require representation and visualization of the data. Representation and visualization of smart cities enable prototyping, demonstration and analysis of smart city concepts for further development. Both physical/geometric and semantic data can be represented and visualized. Representation and visualization of smart cities is a prime application for an integrated approach to leverage standardization since no single standard may address all requirements. This document provides guidance as to what needs to be represented for smart cities and how this can be achieved.

This document describes categories of data associated with smart cities and guidelines for their representation and visualization. It describes how standards can be applied to represent and visualize urban infrastructure, services and features. Use cases are presented that explore how these standards could be applied in smart city analysis and visualization applications.

Information technology — Computer graphics, image processing and environmental data representation — Guidelines for representation and visualization of smart cities

1 Scope

This document ~~provides~~specifies guidelines for the representation and visualization of smart cities. This document:

- a) describes the concepts of a smart city, smart city object and smart city data,
- b) describes categories of data associated with smart cities,
- c) provides guidance for representation of smart cities,
- d) describes guidance for visualization of smart cities,
- e) provides guidance in selecting the appropriate representation and visualization technique for different categories of smart city data using standards, and
- f) provides use cases for applying standards to the representation and visualization of smart cities.

2 Normative references

There are no normative references in the document.

3 Terms, definitions and abbreviated terms

3.1 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1.1

3D city model

representation of an urban environment with a 3D geometry of typical or specific urban objects and structures, with buildings as the most prominent features

3.1.2

analytical data

data that has been derived from properties or applications of a smart city

Note 1 to entry: Examples of analytical data include data describing car traffic and pedestrian movements obtained from sensors.

3.1.3

big data

extensive datasets, primarily with characteristics of volume, variety, velocity and/or variability, that require a scalable technology for efficient storage, manipulation and analysis

ISO/IEC PRF TS 5147:(E)

Note_1-to_entry:-big data is commonly used in many different ways, for example as the name of the scalable technology used to handle big data extensive datasets.

[SOURCE: ISO/IEC 20546:2019, 3.1.2]

3.1.4 **built environment**

human-made environment that includes buildings, roads, bridges, tunnels and city artefacts

3.1.5 **Data Representation Model** **DRM**

standardized representation of the relationships and organization of environmental objects and content within SEDRIS (~~ISO/IEC 18023 series~~)

Note 1 to entry: SEDRIS refers to the ISO/IEC 18023 series.

3.1.6 **Internet of Things** **IoT**

infrastructure of interconnected objects, people, systems and information resources together with intelligent services to allow them to process information of the physical and the virtual world and to react

[SOURCE: ISO/IEC 23093-1:2020(en),2022, 3.2.9]

3.1.7 **physical property**

measurable quantity that describes the state of a system

Note_1-to_entry:-Physical properties can be categorized as mechanical, electrical, optical or thermal and may be scalar values (such as temperature) or vector quantities (such as wind flow).

3.1.8 **presentation**

organization of data into textual, tabular or graphical format

Note_1-to_entry:-This can include non-visual modes of presentation such as audio and haptics.

3.1.9 **representation**

description of a real-world event, system, behaviour or natural phenomenon

Note_1-to_entry:-In this document, representation refers to the digital description of an event, object or system.

3.1.10 **semantic property**

property that does not have a physical basis

Note_1-to_entry:-Building ownership is an example of a semantic property.

3.1.11**smart city**

city that increases the pace at which it provides social, economic and environmental sustainability outcomes and responds to challenges such as climate change, rapid population growth, and political and economic instability by fundamentally improving how it engages society, applies collaborative leadership methods, works across disciplines and city systems, and uses data information and modern technologies to deliver better services and quality of life to those in the city (residents, businesses, visitors), now and for the foreseeable future, without unfair disadvantage of others or degradation of the natural environment

[SOURCE: ISO 37122:2019, 3.4]

Note_1_to_entry: A virtual smart city is its digital/simulated representation.

~~3.1.1~~

[SOURCE: ISO 37122:2019, 3.4, modified — The original Notes to entry have been deleted and replaced by a new Note to entry.]

3.1.12**smart city data**

data that is associated with a smart city

Note_1_to_entry: This refers to data that may be consumed or produced by a smart city function or application.

3.1.13**smart city object**

representation of a distinct object that is part of a real or virtual smart city

Note_1_to_entry: A smart city object may not necessarily contain smart technology. It is used as a general descriptor for a component of a smart city.

3.1.14**spatiotemporal**

associated with positions in space and/or time

~~3.1.2~~**3.1.15****visualization**

rendering of an object, situation or set of information as a chart or image

Note_1_to_entry: Visualization is a subset of presentation restricted to the visual medium.

3.2 -Abbreviated terms

2D ~~Two~~two dimensional

3D ~~Three~~three dimensional

4 Representation and visualization standards

4.1 Standards overview

ISO standards for imagery, environmental representation, visualization and mixed and augmented reality can be applied to smart cities. These are described in the following subsections.

4.2 Representation standards

The SEDRIS series (ISO/IEC 18023-~~1, 2, 3~~ series) provides a suite of standards for environmental representation ~~standard~~. SEDRIS is an infrastructure technology that enables information technology applications to express, understand, share and reuse environmental data. SEDRIS technologies provide the means to represent integrated environmental data (terrain, ocean, air and space), and promote the unambiguous, loss-less and non-proprietary interchange of environmental data. It is a means of organising environmental and feature data, ~~however it yet~~ leaves the (graphical) presentation of that data to other applications, such as X3D² and other visualization tools. SEDRIS was developed for military training simulation and has mainly been applied in that domain. An introduction to SEDRIS is provided in ~~[1]~~ [Reference \[1\]](#).

The components of SEDRIS are:

- ~~functional specification~~ (ISO/IEC 18023-1 ~~SEDRIS Part 1: Functional Specification~~)
- ~~abstract transmittal format~~ (ISO/IEC 18023-2 ~~SEDRIS Part 2: Abstract Transmittal Format~~)
- ~~transmittal format binary encoding~~ (ISO/IEC 18023-3 ~~SEDRIS Part 3: Transmittal Format Binary Encoding~~)
- ~~ISO/IEC 18024-4~~ SEDRIS language bindings – Part 4: C ([ISO/IEC 18024-4](#))
- ~~ISO/IEC 18025 Environmental Data Coding Specification~~ [environmental data coding specification](#) (EDCS) that provides identification (designation) of objects and their attributes ([ISO/IEC 18025](#))
- ~~ISO/IEC 18026 Spatial Reference Model~~ [spatial reference model](#) (SRM) that handles position, orientation and spatial reference frames ([ISO/IEC 18026](#))
- ~~Data Representation Model~~ [data representation model](#) (DRM) that models the relationships between objects and their representations as described in ISO/IEC 18023 series
- ~~Application~~ [application](#) programming interface (API) as described in ISO/IEC 18023 series

EDCS, DRM and SRM all have ISO/IEC managed registries. The EDCS standard and its corresponding registry contain entries for environmental concepts, objects and attributes, with about ~~15001500~~ classifications (types of environmental objects) and ~~19001900~~ attributes. These entries include a wide range of environmental concepts, from natural phenomena to human-made objects, and a large array of attributes and units of measure. Many of the EDCS entries are relevant to smart city modelling and simulation, and new entries can be added through registration to ISO as these are required. Since SEDRIS was developed primarily for military environments, a considerable number of entries can be included to populate civilian urban environments.

SEDRIS is extensible through the ISO registration system for EDCS and SRM for new objects, features and coordinate systems. It includes Levels of Detail and georeferencing. While developed for military use SEDRIS can also represent civil assets and systems such as a smart city.

² X3D is a trademark of the Web3D Consortium. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC.
