## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO ~~documents~~document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2—(see [www.iso.org/directives](http://www.iso.org/directives)).

~~Attention is drawn~~ISO draws attention to the possibility that ~~some of the elements~~implementation of this document may ~~be involve~~ the ~~subject~~use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of ~~any claimed~~ patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at [www.iso.org/patents](http://www.iso.org/patents). ISO shall not be held responsible for identifying any or all such patent rights. ~~Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received.~~

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation ~~of the voluntary nature of standards~~, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html) the following URL: <https://standards.iteh.ai/catalog/standards/sist/9c547097-31ef-4e6f-96ce-da4befdcd8ea/iso-dts-22298>

~~The committee responsible for~~ This document ~~is~~was prepared by Technical Committee ISO/TC 229, Nanotechnologies.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

## Introduction

Silica with ordered nanopore array (SONA) is expected to act as novel catalysts and adsorbents because of the presence of their uniform nanopores. In addition to ~~them~~SONA, recently developed synthetic strategies have created a huge number of compositional and morphological variations. Therefore, ~~it~~SONA is expected to be applied in various fields such as electronics, optics, and materials. They ~~have stimulated various applications such as electronic, photonic, and materials applications. Also, they also~~ have potential uses as electrodes for fuel cells and hydrogen-storage materials, all of which are owing to the presence of periodic nanopore and the physical properties of inorganic frameworks.

SONA as described in the previous reports<sup>[1-4]</sup> has an amorphous structure like silica-gel and exhibits a honeycomb (hexagonal), 3D (cubic) and wormhole (gyroid) pore structure (see Annex A) with ordered cylindrical channels from 2 nm to 50 nm in diameter. The pores are constructed with thin silica walls which are connected to form the regular pore arrangements. The delicate structures of silica walls and their connected structures are influenced by their preparation, aging and storage conditions. The global SONA market is anticipated to witness significant growth on account of a wide range of existing and potential applications of the product in electronics, biomedical, drug delivery, and optical fields. A market survey shows extensive use of SONA in the chemical industry as a catalyst support for synthesis of various chemicals<sup>[6]</sup>.

SONA have a variety of industrial applications as catalysts, adsorbents, molecular sieve, where their properties and use cases highly depend on their production processes that affect their nanopore arrangements. They do not have long-range SiO<sub>2</sub> ordering confirmed by powdered X-ray diffraction, showing XRD peaks in low angle region (see Annex A). Having the ability to characterize these materials helps developers adapt to new research frontiers such as bulky organometallic or inorganic complexes, biosensors from embedded enzymes on nanostructured silica<sup>[7,8]</sup> to application in energy-efficient desiccation. Standardization of SONA can unify different types of SONA test reports in industry. This allows users to compare or select most suitable and qualified SONA for their applications.

### Technical Specification

## **Nanotechnologies — Silica nanomaterials — Characteristics and measurement methods for silica with ordered nanopore array (SONA)**

### **1 Scope**

This document specifies the characteristics of ~~silica~~ samples of silica with ordered nanopore array (SONA) to be measured in powder form and ~~specifies the~~ industrially available measurement methods used to determine said characteristics. ~~It~~ This document provides a sound base for the research, development, and commercialization of SONA for various applications.

# ~~Nanotechnologies – Silica nanomaterials – Specification of characteristics and measurement methods for silica with ordered nanopore array (SONA)~~

## ~~1—1 Scope~~

~~This document specifies characteristics to be measured and their measurement methods of silica with ordered nanopore array (SONA) in powder form.~~

~~-This document excludes silica-gel, fumed silica and chemically modified SONA.~~

~~NOTE 1—The pore size of SONA ranges usually from one ~~nanometer~~nanometre to several tens of ~~nanometers~~nanometres.~~

## ~~2 Normative references~~

~~ISO/TS 80004-2 Nanotechnologies – Vocabulary – Part 2: Nano-objects~~

~~ISO/TS 80004-4 Nanotechnologies – Vocabulary – Part 4: Nanostructured materials~~

~~ISO/TS 80004-6 Nanotechnologies – Vocabulary – Part 6: Nano-object characterization~~

~~There are no normative references in this document.~~<sup>3</sup>

## ~~3 Terms and definitions~~

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at <https://www.iso.org/obp>

— IEC Electropedia: available at <https://www.electropedia.org/>

<https://standards.iteh.ai/catalog/standards/sist/9c547097-31ef-4e6f-96ce-da4befdcd8ea/iso-dts-22298>

### ~~3.1~~

#### ~~area equivalent diameter~~

diameter of a circle having the same area as the projected image of the particle

Note 1 to entry: It is also known as the Heywood diameter or as the equivalent circular diameter.

[SOURCE: ISO 13322-1:2014~~(en)~~, 3.1.1]

### ~~3.2~~

#### ~~Feret diameter~~

~~$X_F$~~

distance between two parallel tangents on opposite sides of the image of a particle

Note 1 to entry: Maximum diameter  $X_{Fmax}$  corresponding to the “length” of the particle and minimum diameter  $X_{Fmin}$  corresponding to the “breadth” of the particle.

[SOURCE: ISO 13322-~~2:2004~~, ~~3.1.6-1:2014~~, 3.1.6, modified — Note 1 to entry has been added.]

### ~~3.3~~

#### ~~nanopore~~

cavity with at least one dimension in the *nanoscale* (3.4), which ~~may~~can contain a gas or liquid

Note 1 to entry: The shape and content of the cavity can vary. The concept of nanopore overlaps with micropore (*i.e.* pore with width of about 2 nm or less), mesopore (*i.e.* pore with width between approximately 2 nm and 50 nm), and macropore (*i.e.* pore with width greater than about 50 nm).

Note 2 to entry: When nanopores are appropriately interconnected, they ~~may~~*can* allow for transport through the material (*i.e.* permeability).

[SOURCE: ISO/TS 80004-4, 2.13]

1:2023, 3.4.3, modified — Notes 1 and 2 to entry have been added.]

### 3.4

#### nanoscale

size range from approximately 1 nm to 100 nm

Note 1 to entry: Properties that are not extrapolations from a larger size will typically, but not exclusively, be exhibited in this size range. For such properties, the size limits are considered approximate.

Note 2 to entry: The lower limit in this definition (approximately 1 nm) is introduced to avoid single and small groups of atoms from being designated as nano-objects or elements of nanostructures, which ~~might~~*can* be implied by the absence of a lower limit.

[SOURCE: ISO/TS 80004-1:2010, 2023, 3.1.1, modified — Notes 1 and 2.1] to entry have been added.]

### 3.5

#### ordered nanopore array

*nanopores* (3.3) formed and arranged in a pattern according to the specified rule

Note 1 to entry: The ordered nanopore array can be fully or partially regular depending on the *SONA* *silica with ordered nanopore array* (3.7) sample.

Note 2 to entry: See Annex A for the types of pore array.

### 3.6

#### particle size

~~dimension that is representative of the size of an individual particle~~

~~Note to entry: The particle size is usually expressed as Feret diameter or area equivalent diameter {diameter of sediment particles}~~

[SOURCE: ISO 772:2011(en), 6.37 modified, note to entry added.] 2022, 8.41]

### 3.7

#### pore size

pore width, *i.e.* ~~the~~ diameter of cylindrical pore or distance between opposite walls of slit.

[SOURCE: ~~ISO 15901~~ISO 15901-2:2022, 3.17]

### 3.8

#### pore size distribution

fraction by numbers or by volume of each classified *pore size* (3.7) which exists in a material

Note 1 to entry: ~~The~~ pore size distribution is usually expressed by the full width at half maximum of the distribution main peak.

[SOURCE: ISO 3252:20192023, 3.3.47, modified — "percentage" has been replaced with "fraction" in the definition and Note 1 to entry has been added.]

### 3.9

**silica with ordered nanopore array**

**SONA**

amorphous silica containing internal structures in the form of *ordered nanopore array* (3.5)

## 4 4-Abbreviated terms

~~AAS — atomic absorption spectrometry~~

~~AFM — atomic force microscopy~~

~~BET — Brunauer–Emmett–Teller~~

~~BJH — Barrett–Joyner–Halenda~~

~~DSC — differential scanning calorimetry~~

~~EDX — energy dispersive X-ray spectrometry~~

~~EPMA — electron probe micro analyser~~

~~ICP — inductively coupled plasma~~

~~IR — infrared spectrometry~~

~~SEM — scanning electron microscopy~~

~~Si-MAS-NMR — silicon magic angle spinning nuclear magnetic resonance~~

~~TEM — transmission electron microscopy~~

<https://standards.iteh.ai/catalog/standards/sist/9c547097-31ef-4e6f-96ce-da4befdcd8ea/iso-dts-22298>

~~TGA — thermal gravimetric analysis~~

~~XRD — X-ray diffraction~~

~~XRF — X-ray fluorescence spectrometry~~

~~XPS — X-ray photoelectron spectrometry~~

AAS — atomic absorption spectrometry

AFM — atomic force microscopy

BET — Brunauer–Emmett–Teller

BJH — Barrett–Joyner–Halenda

EDX — energy dispersive X-ray spectrometry

EPMA — electron probe micro analyser

ICP — inductively coupled plasma

SEM — scanning electron microscopy

TEM — transmission electron microscopy
