ISO/FDIS 8025

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawnISO draws attention to the possibility that some of the elementsimplementation of this document may be involve the subjectuse of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 159, *Ergonomics*, Subcommittee SC 5, *Ergonomics of the physical environment*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

This document belongs to a group of thermal standards intended for use in the assessment and management of work in the heat.

Several outdoor and indoor lines of industries, commerce and occupations involve substantial exposure where individuals can be exposed to high temperatures, humidity and/or thermal radiation. Working in such hot environments can lead to several adverse effects on human performance and health, such as thermal discomfort, increased strain, decreased performance and heat-related disorders. Heat can also interfere with several other factors in the workplace, modifying or aggravating the risk of common hazards and increasing the risk of heat-associated disorders. In addition, skin contact with hot surfaces can lead to burns.

Due to the negative impact of heat on human health and performance, as well as on work productivity, quality and safety, it is necessary to consider a comprehensive strategy of risk assessment and management practices.

While other standards have described specific indices to be used to assess the hot work environment and the potential physiological consequences, this document describes the methods and practices to organize the management of these work environments and the supervision of the exposed persons.

The choice of when to use the methods described in this document is at the discretion of the persons responsible for occupational safety and/or health.

ISO/FDIS 8025

Ergonomics of the thermal environment — Management of working conditions in hot environments

1 Scope

This document adopts <u>ann</u> approach where actions, particularly control measures and medical supervision, are specified as a function of the class of severity of the potential effects. It provides instructions for appropriate management practices for hot workplaces and describes:

- a procedure for managing work in hot environments;
- guidelines on how to apply the different International Standards in the field of thermal environments when assessing heat-related risks;
- guidelines to organize the medical supervision of the people working in hot environments;
- information for instructing the persons working in hot environments;
- an example of assessment of a hot working situation.

The procedure described in this document aims to anticipate the problems related to work in warm to hot environments by classifying the different work situations according to their potential health effects, informing the persons concerned – workers and management – of the seriousness of these effects, planning appropriate measures to be implemented to prevent these effects and providing medical surveillance of exposed persons.

This document supports good occupational safety and health practices and is applicable to both indoor and outdoor work situations.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms, definitions and symbols

3.1 Terms and definitions

No terms and definitions are listed in this document.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at https://www.iso.org/obp
- ——IEC Electropedia: available at https://www.electropedia.org/

3.2 Symbols and abbreviated terms

Symbol or abbreviated term	Definition	Units
$D_{ m lim}$	duration limit of exposure	min

Symbol or abbreviated term	Definition	Units
EC	exposure class of a work situation	
I_{cl}	static (or basic) clothing thermal insulation	clo
М	metabolic rate	W
$ ho_{\mathrm{a}}$	partial water vapour pressure	kPa
PHS	predicted heat strain	_
PMV	predicted mean vote	_
PPD	predicted percentage of dissatisfied	%
RH	relative humidity	%
ta	air temperature	°C
tg	globe temperature	°C
TEF	thermal exposure form of a work situation	
<i>v</i> _a	air velocity	m·s=1
WBGT	wet bulb globe temperature	°C
WBGTlim	limit of the WBGT index as a function of metabolic rate	°C

4 Classification of the working situations in hot environments

4.1 General

The nature and the urgency of the control measures to improve and eliminate a working situation where a heat-related health problem $\frac{\text{might}\text{could}}{\text{might}\text{could}}$ occur depend upon the severity of this problem. $\frac{\text{Table 1}}{\text{Table 1}}$ defines the six $\frac{\text{exposure classes (EC)ECs}}{\text{classes (EC)ECs}}$ and the classification criteria, according to the PMV value and the D_{lim} of the thermal condition, according to the PMV value and the Dlim of the thermal condition. As defined in ISO 7933, D_{lim} is the duration of exposure after which either the total sweating exceeds 3 $\frac{1}{1000}$ of the body weight of the average worker, or the core temperature reaches 38 °C.

 $Table\ 1 - Definition\ of\ the\ {\color{red} \underline{6}\ Exposure\ Classes\ (EC)}\underline{six\ ECs}\ for\ hot\ working\ situations$

EC	Definition	Criteria
1	Thermal comfort as defined in ISO 77301	- <u>-</u> 0,7 < PMV < 0,7
2	Light thermal discomfort	0,7 ≤ PMV < 1,7
3	Strong thermal discomfort	1,7 ≤ PMV and D_{lim} ≥ 480 min
4	Thermal constraint in the long term	120 < D _{lim} < 480 min
5	Thermal constraint in the short term	30 < D _{lim} ≤ 120 min
6	Immediate thermal constraint	$D_{\text{lim}} \le 30 \text{ min}$

This document describes the procedure to identify as soon as possible the EC of a given work environment, select accordingly the optimal control measures to eliminate or minimize the exposure, organize the working situation in consequence and protect adequately the exposed persons.

 $[\]underline{^{1}\ Under\ preparation}.\ Stage\ at\ the\ time\ of\ publication:\ ISO/DIS\ 7730:2023.$

4.2 Risk management system

The heat risk management model shall be fully integrated into the occupational health and safety (OHS) management system and practices of the organisation organization, to ensure the implementation and continuance of the activities.

NOTE This kind of system can be established according to, for example, ISO 45001, which was prepared to be compatible with ISO 9001 for quality management systems/systems and ISO 14001 for environmental management <a href="mailto:systems/sys

4.3 Exposure assessment and prevention procedure

4.3.1 Introduction

4.3.1 General

The exposure assessment procedure follows the principles presented in ISO 15265, with the addition of an initial stage for the recognition of the situations where a heat-related health problem might-could occur. The procedure therefore includes four stages and is illustrated in Figure 1 derived from ISO 15265.

- ——Stage 1, screening: where the working situations that are causing or are likely to lead to heat stress exposures are identified and listed.
- ——Stage 2, observation: where the working situations identified in stage 1 are reviewed qualitatively
 to determine the simple and straightforward measures to be implemented to reduce the class of the
 working situation to EC1EC 1, or at least EC2EC 2.

A decision is made to perform a further analysis if the problem is neither eliminated nor sufficiently reduced, or whenever it is uncertain whether the preventive actions will be or have been sufficient to guarantee the persons' health and safety.

— Stage 3, analysis: where quantitative evaluations are made of the parameters characterisingcharacterizing the working situations and the thermal indices defined in ISO 7730 (PMV and PPD), ISO 7243 (WBGT) and ISO 7933 (PHS) are computed. Additional control or organisational measures are determined and their effects to improve the working situations are evaluated.

It is anticipated that most common problems of work in hot situations can be managed using the methods and procedures in stages 1 to 3. For unusual or peculiar work circumstances, a further expertise stage is conducted (stage 4).

— Stage 4, expertise: will usually deal with highly complex thermal working circumstances and require sophisticated or specific measurements. This stage is conducted by the same persons as stage 3, with the additional assistance of highly specialised experts. The approach and techniques that are required will vary according to the nature of the problem and are within the responsibility of the intervening experts. This stage will therefore not be further discussed in this document.
