THIS DOCUMENT IS A DRAFT CIRCULATED FOR COMMENT AND APPROVAL. IT IS THEREFORE SUBJECT TO CHANGE AND MAY NOT BE REFERRED TO AS AN INTERNATIONAL STANDARD UNTIL PUBLISHED AS SUCH.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

This document is circulated as received from the committee secretariat.

53 Foreword

54 ISO (the International Organization for Standardization) and IEC (the International Electrotechnical
55 Commission) form the specialized system for worldwide standardization. National bodies that are
56 members of ISO or IEC participate in the development of International Standards through technical
57 committees established by the respective organization to deal with particular fields of technical activity.
58 ISO and IEC technical committees collaborate in fields of mutual interest. Other international
59 organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the
60 work. In the field of information technology, ISO and IEC have established a joint technical committee,
61 ISO/IEC JTC 1.

62 The procedures used to develop this document and those intended for its further maintenance are
63 described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the
64 different types of document should be noted. This document was drafted in accordance with the editorial
65 rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

66 Attention is drawn to the possibility that some of the elements of this document may be the subject of
67 patent rights. ISO and IEC will not be held responsible for identifying any or all such patent rights. Details
68 of any patent rights identified during the development of the document will be in the Introduction and/or
69 on the ISO list of patent declarations received (see www.iso.org/patents).

70 Any trade name used in this document is information given for the convenience of users and does not
71 constitute an endorsement.

72 For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and
73 expressions related to conformity assessment, as well as information about ISO's adherence to the World
74 Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following
75 URL: www.iso.org/iso/foreword.html.

76 This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*,
77 Subcommittee SC 42, *Artificial intelligence*.

78 Any feedback or questions on this document should be directed to the user's national standards body. A
79 complete listing of these bodies can be found at www.iso.org/members.html.

80 Introduction

81 AI systems are being adopted by organizations of all types, sizes and purposes. Data is essential to the
82 development and operation of AI systems.

83 In the field of AI systems, there are any number of data life cycles in use and under consideration for
84 different purposes (e.g. data quality, bias in data, data governance, development and use of AI systems).
85 Without an overarching framework, these different data life cycles can be challenging to correctly
86 interpret by those without previous knowledge, context and expertise. There is a risk that these multiple
87 data life cycles will not be applied as intended.

88 The purpose of this document is to provide a data life cycle framework, including terms and concepts,
89 that can be referenced by specialized data life cycles. The aim is to make it easier for users in different
90 roles to understand and correlate specialized data life cycles and how they apply to their organization's
91 needs by describing a set of high-level data life cycle stages.

92 Information technology — Artificial intelligence — Data life cycle 93 framework

94 1 Scope

95 This document is applicable to the data processing throughout the AI system life cycle including the
96 acquisition, creation, development, deployment, maintenance and decommissioning. This document is
97 applicable to the acquisition, creation, development, deployment, maintenance and decommissioning of
98 data in AI systems. This document does not define specific services, platforms or tools. This document is
99 applicable to all organizations, regardless of type, sizes and nature, that use data in the development and
100 use of AI systems.

101 2 Normative references

102 The following documents are referred to in the text in such a way that some or all of their content
103 constitutes requirements of this document. For dated references, only the edition cited applies. For
104 undated references, the latest edition of the referenced document (including any amendments) applies.

105 ISO/IEC 22989:-1), *Information technology — Artificial intelligence — Artificial intelligence concepts and*
106 *terminology*

107 3 Terms and definitions

108 For the purposes of this document, the terms and definitions given in ISO/IEC DIS 22989:— apply.

109 ISO and IEC maintain terminological databases for use in standardization at the following addresses:

110 — ISO Online browsing platform: available at <https://www.iso.org/obp>

111 — IEC Electropedia: available at <http://www.electropedia.org/>

112 4 Symbols and abbreviated terms

117	OWL	web ontology language
118	PII	personally identifiable information
119	XML	extensible markup language

120 5 Data life cycle overview

121 The data life cycle for AI systems encompasses the processing of data from the earliest conception of a
122 new AI system to the eventual decommissioning of the system and is separated into a number of distinct
123 stages. Each stage will often, but not always, be part of a data life cycle for an AI system.

124 A data life cycle represents all the stages through which data can pass within any system that uses data of
125 any kind. It is designed to support the achievement of objectives related to system governance, system
126 utility, data quality and data security, by ensuring that data processing is given due consideration during
127 the planning, development, use and decommissioning of the system.

128 The detailed purpose and timing of use of these stages throughout the life cycle are influenced by multiple
129 factors, including societal, commercial, organizational and technical considerations, each of which can
130 vary during the life of a system. This document describes the following 10 stages:

131 — Stage 1 - Idea conception ;

132 — Stage 2 - Business requirements ;

133 — Stage 3 - Data planning;

134 — Stage 4 - Data acquisition;

135 — Stage 5 - Data preparation;

136 — Stage 6 - Building model;

137 — Stage 7 - System deployment;

138 — Stage 8 - System operation;

139 — Stage 9 - Data decommissioning;

140 — Stage 10 - System decommissioning.

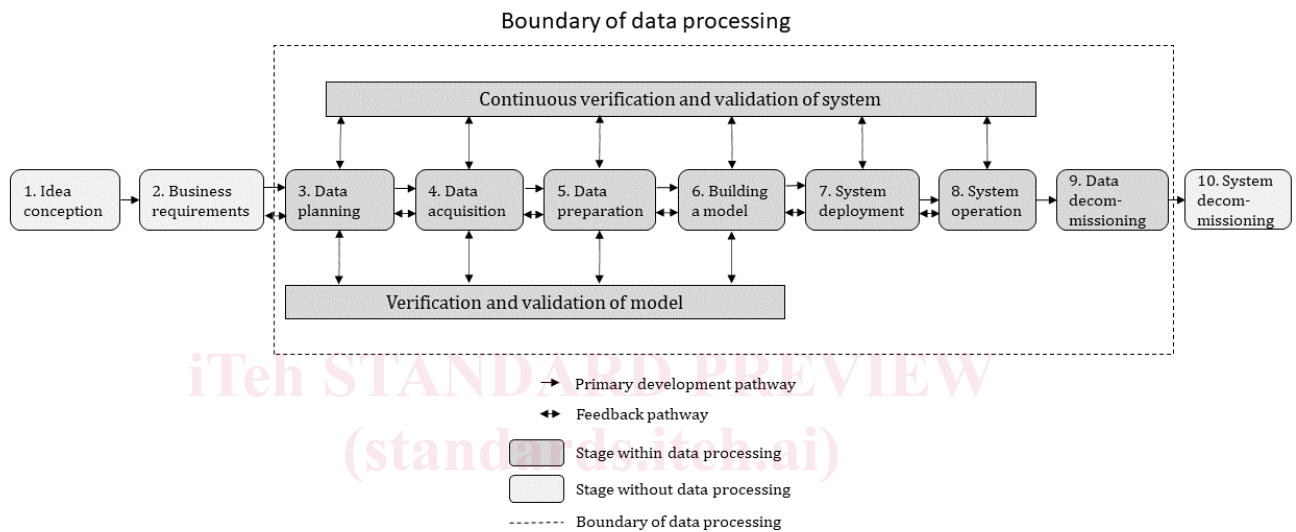

141 6 Data life cycle framework

142 6.1 General

143 The data life cycle framework, shown in Figure 1, identifies a set of distinct stages that data used in an AI
144 system go through from data planning to data decommissioning. Figure 1 also includes idea conception,
145 business requirements and system decommissioning which are system level life cycle stages.

146 For information regarding datasets refer to FDIS ISO/IEC 23053:-2) [3]. Life cycle processes, appropriate
 147 to a defined task, can be assigned to each stage. Life cycle processes describe the actions taken on the
 148 data within the life cycle stage.

149 Stage 9 (data decommissioning) and stage 10 (system decommissioning) both pertain to
 150 decommissioning but stage 9 specifically covers what happens to the data (e.g. deletion, destruction,
 151 return) while stage 10 covers what happens to the system irrespective of what happens to the data.

iTeh STANDARD PREVIEW

 ISO/IEC FDIS 8183

<https://standards.iteh.ai/catalog/standards/sist/0cb0b8a4-2d3b-4ab3-a05f-09bd8866488c/iso-iec-fdis-8183>

152
 153

Figure 1 — Data life cycle framework

154 NOTE 1 The single-headed arrows in Figure 1 depict a linear path through the life cycle stages while the double-
 155 headed arrows show feedback paths between life cycle stages.

156 NOTE 2 The verification and validation of the model refers to the internal development process whose output is
 157 a model. The validation and verification of the system refers to the system as a whole extending through its entire
 158 period of operation.

159 **6.2 Stage 1: Idea conception**

160 Idea conception is when a need or requirement for a new or revised AI system is recognized. The AI
 161 system can be used as a partial or a complete solution to an existing or potential problem or opportunity
 162 faced by the organization.

2) Under preparation. Stage at the time of publication: ISO/IEC FDIS 23053:—

Idea conception can also be driven by broader organizational context needs (e.g. economic, technical, strategic, market or legal requirements). Ultimately, this idea should be expressed as one or more questions that the AI system can answer.

6.3 Stage 2: Business requirements

The business requirements stage involves one or more stakeholders, with appropriate authority or influence deciding 1) to investigate whether the idea can be turned into a functioning system and 2) deciding whether to invest further in the idea. This stage involves:

- determining the ambition of the project (e.g. vision, goals and strategy);
- determining assets including those available and those that need to be acquired;
- specifying the data requirements, a key element for AI systems, based on the business goals and end-user requirements can be defined at this stage;
- identifying enablers for the project including in-house skills and knowledge, organizational architecture, technology and external resources;
- ensuring the project can be developed in line with organizational policies and procedures (or processes) including:
 - compliance (e.g. privacy requirements);
 - ethics (e.g. fairness of outcomes);
 - culture;
 - leadership;
 - governance processes.
- the business requirements stage concludes with a determination of whether or not the project is feasible.

NOTE No data is processed at the business requirements stage.

6.4 Stage 3: Data planning

The data planning stage involves deciding upon the scope of the data required to address the questions identified in the business requirements. The primary data factors for consideration at this stage include:

- data existence: whether the necessary data exists, is available for reuse, needs to be acquired, transformed, authored, curated, etc. or a combination of some or all of these;
- amount of data required;
- source of data;
- synthetic, i.e. artificial, data can be created to augment available data;
