Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 123, *Plain bearings*, Subcommittee SC 2, *Materials and lubricants, their properties, characteristics, test methods and testing conditions*.

This second edition cancels and replaces the first edition (ISO 4385:1981), which has been technically revised.

The main changes compared to the previous edition are as follows:

- change of scope;
- restructure of the document;
- implementation of [Clause 2](#);
- revision of [Clause 3](#), Terms and definition;
- implementation of [Clause 4](#);
- revision and of [Clause 4 and 5](#), and implementation of [Figures 1, 2, 3, 4, 5 and 6](#);
- revision and of [Clause 4 and 5](#), and implementation of [Figures 1, 2, 3, 4, 5 and 6](#);
- revision of [Clause 6](#).

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Plain bearings — Compression testing of bearing materials

1 Scope

This document specifies a method for compression testing of bearing materials. It is applicable for both bulk materials and coatings.

Compression testing within the meaning of this document serves for the determination of the behaviour of bearing materials under uniaxial compression loading which is uniformly distributed over the cross-section. For this purpose, a cylindrical specimen or a setup of two such specimen, with an original cross-section, A_0 , is loaded at constant crosshead speed and the resulting compressive stress and compressive strain are recorded.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the last edition of the referenced document (including any amendments) applies.

ISO 1101, *Geometrical product specifications (GPS) — Geometrical tolerancing — Tolerances of form, orientation, location and run-out*

ISO 7500-1, *Metallic materials — Calibration and verification of static uniaxial testing machines — Part 1: Tension/compression testing machines — Calibration and verification of the force-measuring system*

ISO 9513, *Metallic materials — Calibration of extensometer systems used in uniaxial testing*

ISO 21920-1, *Geometrical product specifications (GPS) — Surface texture: Profile — Part 1: Indication of surface texture*

ISO 21920-2, *Geometrical product specifications (GPS) — Surface texture: Profile — Part 2: Terms, definitions and surface texture parameters*

3 Terms and definitions

No terms and definition are listed in this document.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

4 Symbols

For the purposes of this document, the symbols and definitions as listed in [Table 1](#) apply.

Table 1.— Symbols description and units

Symbol	Description	Unit
A_0	Original cross-sectional area of a specimen prior to loading. A_0 is calculated using the original diameter as $A_0 = \pi/4 \cdot d_0^2$.	mm ²
A_u	Final cross-sectional area of a specimen after loading. A_u is calculated using the final diameter as $A_u = \pi/4 \cdot d_u^2$.	mm ²
d_0	Original diameter, diameter of a compression specimen prior loading, calculated as the mean of two measurements taken at the specimen centre at right angles to each other. NOTE— The original cross-sectional area of the specimen prior to loading, A_0 , is calculated using this diameter ($A_0 = \pi/4 \cdot d_0^2$).	mm
d_u	Final diameter, diameter of a compression specimen after loading, calculated as the mean of two measurements taken at the axial specimen centre at right angles to each other. NOTE— The final cross-sectional area of the specimen, A_u , is calculated using this diameter ($A_u = \pi/4 \cdot d_u^2$).	mm
d_s	Compression plate diameter	mm
E_b	Elastic modulus of specimen base material	MPa
e_c	Compressive strain; percentage change in gauge length (L_e or L_0) as given in Formulae (1) and (2): <div style="display: flex; align-items: center; justify-content: center;"> <div style="border: 1px solid black; padding: 10px; margin: 10px;"> $e_c = \frac{\Delta L_e}{L_e} \cdot 100$ $e_c = \frac{\Delta L_0}{L_0} \cdot 100$ </div> <div style="margin: 0 20px;"> or </div> <div style="border: 1px solid black; padding: 10px; margin: 10px;"> $e_c = \frac{\Delta L_e}{L_e} \cdot 100$ $e_c = \frac{\Delta L_0}{L_0} \cdot 100$ </div> </div> <p>(determined directly at the specimen using an extensometer) (1)</p> <p>(determined via displacement of the compression dies) (2)</p> <p>NOTE— The compressive strain e_c is the sum of elastic and plastic strain.</p>	%
e_{ce}	Elastic compressive strain of the original gauge length section; reversible component of compressive strain	%
$e_{c \text{ eff}}$	Calculated change rate of strain	%
e_{cF}	Compressive strain at fracture, percentage change in gauge length (L_e or L_0) at fracture of the specimen, as given in Formulae (3) and (4): <div style="display: flex; align-items: center; justify-content: center;"> <div style="border: 1px solid black; padding: 10px; margin: 10px;"> $e_{cF} = \frac{\Delta L_{eF}}{L_e} \cdot 100$ $e_{cF} = \frac{\Delta L_{0F}}{L_0} \cdot 100$ </div> <div style="margin: 0 20px;"> or </div> <div style="border: 1px solid black; padding: 10px; margin: 10px;"> $e_{cF} = \frac{\Delta L_{eF}}{L_e} \cdot 100$ $e_{cF} = \frac{\Delta L_{0F}}{L_0} \cdot 100$ </div> </div> <p>(determined directly at the specimen using an extensometer) (3)</p> <p>(determined via the displacement of the compression dies) (4)</p>	%
