## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part-1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part-2 (see [www.iso.org/directives](http://www.iso.org/directives)).

~~Attention is drawn to the possibility that some of the elements of this document may be the subject of a patent rights. ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at [www.iso.org/patents](http://www.iso.org/patents). ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see [www.iso.org/patents](http://www.iso.org/patents)).~~

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ~~for Project Committee~~ ISO/TC ~~for ISO/PC~~ ###, ~~name~~156, ~~Corrosion of~~ ~~committee~~, Subcommittee SC ##, ~~name of subcommittee~~.

~~This second/third/... edition cancels metals and replaces the first/second/... edition (ISO #####), which has been technically revised.~~

The main changes compared to the previous edition are as follows:

~~xxx xxxxxxx xxx xxx~~

A list of all parts in the ISO ##### series can be found on the ISO website [www.iso.org](http://www.iso.org).

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

ISO/DTR 8547:(E)

## Introduction

At present, the mainstream method of classifying environmental corrosion is that specified in ISO 9223. This is a method in which the corrosion rates of various metals are classified in ~~6~~six levels based on the results of direct exposure tests conducted around the world. However, the exposure sites were located only in Japan for the exposure tests in Asian Monsoon region, in which East-Asia, South-Asia and East-South Asia are included and the climates are affected by monsoons. Thus, standardization of an evaluation/classification method suited to the Asian Monsoon region has been strongly desired. Therefore, exposure tests were conducted in three countries including Japan, ~~that is, Japan,~~ Vietnam and Thailand, under ~~the~~ “e-Asia Project”.

This ~~report~~document summarizes the exposure test results for carbon steel and galvanized steel sheet.

iTeh STANDARD PREVIEW

# Corrosion of metals and alloys — Exposure test results in the Asian Monsoon region

## 1 Scope

This document provides the data of exposure test results for carbon steel and galvanized steel sheets in three countries, Japan, Vietnam and Thailand, under the “e-Asia Project” as valuable information on the corrosivity of atmospheres in the world.

## 2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

~~ISO 8407: 2009, Corrosion of metals and alloys — Removal of corrosion products from corrosion test specimens~~

~~ISO 9223: ISO 9223: 2012, Corrosion of metals and alloys — Corrosivity of atmospheres — Classification, determination and estimation~~

~~ISO 9225: 2012, Corrosion of metals and alloys — Corrosivity of atmospheres — Measurement of environmental parameters affecting corrosivity of atmospheres~~

~~JIS Z 382: 1998, Determination of pollution for evaluation of corrosivity of atmospheres~~

## 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 9223, and ISO 9225 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <http://www.electropedia.org/>

ISO/DTR 8547:(E)

#### 4 Exposure ~~Teststests~~

The coupons of carbon steel and galvanized steel sheet were exposed in outdoor environments at 16 exposure test sites in Japan, 13 sites in Vietnam and 7 sites in Thailand as shown in ~~Figure 1-Figure 1~~. Specimens of 3-mm thickness and are 70-mm ~~×~~ 150-mm of carbon steel and specimens of 1-mm thickness and 70-mm ~~×~~ 150-mm of galvanized steel sheet were used for exposure tests. The specimens of carbon steel were exposed both sides. For the specimens of galvanized steel sheet, the backside and cut edge of the coupons were covered by polyethylene sheet after degreasing the specimen in acetone. The exposed surfaces of specimens were exposed to skyward and groundward as shown in ~~Photo 1-Figure 2~~. The corrosion products on the exposed specimens were removed by using chemical solutions according to ISO 8407, and the weight losses were measured to determine the corrosion rate.

For the environmental factors, monthly amounts of airborne salinity and SO<sub>2</sub> were measured by “Dry gauze” and “PbO<sub>2</sub> cylinder”, respectively, based on JIS Z 2382. The temperature, relative humidity, and ACM sensor output, I, were recorded in a microcomputer every 10-min.

For the annual average values of Cl<sup>-</sup> deposition, S, and SO<sub>2</sub> deposition, P, those values based on JIS Z 2382, S(JIS) and P(JIS), respectively, were converted to S and P based on ISO 9225-~~(2012, Annex-F)~~:

$$S = 2,4 S(\text{JIS})$$

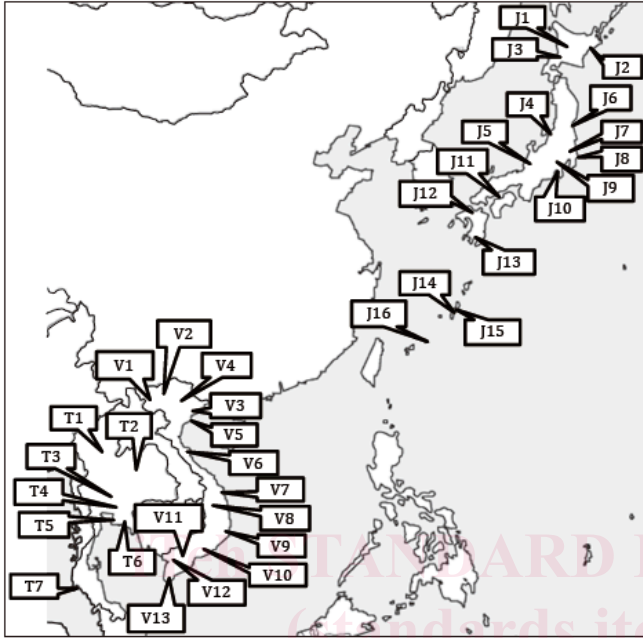

$$P = 0,67 P(\text{JIS})$$

~~Note 1-NOTE~~ Some of numerical data are available from data sources given in ~~Annex A (informative)-Annex A~~.
