Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 172, *Optics and photonics*, Subcommittee SC 7, *Ophthalmic optics and instruments*.

This first edition of ISO 16971-1 cancels and replaces the first edition (ISO 16971:2015), which has been technically revised.

The main changes are as follows:

- revision of the dated references;
- document restructured;
- definitions added with particular emphasis on performance parameters;
- added example performance parameters;
- clarified requirements for presentation of OCT images;
- clarified minimum requirements for data exchange; DICOM required;
- test methods not mandatory anymore; added additional test methods;
- extended requirements for the information to be supplied by the manufacturer;
- deleted annex on *Minimum requirements for a normative database*;
- [Annex A Example for test device](#) added.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

Until the early 21st century, it was impossible to obtain clinically relevant depth-resolved information of the inner structures of the human eye, including those of the retina. With optical coherence tomography (OCT), eye care practitioners now have an available non-invasive method that allows the rapid generation of high-resolution three-dimensional in vivo images of the eye. Before the first edition of ISO 16971 was published, there were no well-defined and widely accepted requirements for either OCT instruments or the data collected and displayed with them. Consequently, it was very difficult to compare the instruments, their measurement results, and clinically relevant diagnostic findings based on them.

The first edition of ISO 16971 was an important first step towards defining the necessary terminology and performance requirements for OCT instruments and to establishing standardized framework conditions for the application of OCT technology to ophthalmic imaging.

This edition continues the task by extending the requirements of ISO 16971 and specifying a more comprehensive set of characteristics for OCT instruments. To facilitate this, ISO 16971 has been divided with this document serving as the first part addressing OCT instruments for the posterior segment of the human eye.

Ophthalmic instruments — Optical coherence tomographs —

Part 1:

Optical coherence tomographs for the posterior segment of the human eye

1 Scope

This document is applicable to optical coherence tomography (OCT) instruments, systems, and methods that are intended to image and measure the biological tissue of the posterior segment of the human eye.

This document specifies characteristics and minimum requirements for OCT instruments and systems. It specifies type tests and procedures to verify that a system or instrument qualifies as an OCT instrument or system in accordance with this document.

NOTE In this document the term OCT refers to ophthalmic applications.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO 15004-1, *Ophthalmic instruments — Fundamental requirements and test methods — Part 1: General requirements applicable to all ophthalmic instruments*

ISO 15004-2, *Ophthalmic instruments — Fundamental requirements and test methods — Part 2: Light hazard protection*

IEC 60601-1, *Medical electrical equipment — Part 1: General requirements for basic safety and essential performance*

IEC 60825-1, *Safety of laser products — Part 1: Equipment classification and requirements*

NEMA PS3/ISO 12052, *Digital Imaging and Communications in Medicine (DICOM) Standard*, National Electric Manufacturers Association, Rosslyn, VA, USA (available free at <https://www.dicomstandard.org/>).

3 Terms, definitions and symbols

For the purposes of this document, the terms and definitions given in ISO 15004-1 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1 General

3.1.1

A-scan

one-dimensional axial profile of sample reflectance

Note 1 to entry: axial is the direction of incidence of the measuring beam.

Note 2 to entry: An A-scan is typically depicted either as a plot of reflectance versus depth or as a column in a B-scan image with intensity corresponding to reflectance.

3.1.2

B-scan

two-dimensional cross-sectional measurement of sample reflectance, typically depicted on a display as intensity as a function of depth and transverse position

Note 1 to entry: A B-scan is often constructed by transverse scanning and placing neighbouring A-scans side by side.

3.1.3

en-face OCT image

2D transverse OCT image derived from the OCT signal between transverse surfaces in an OCT volume, where these transverse surfaces are usually derived by image processing that identifies boundaries between layers in the tissue

Note 1 to entry: Typically, an en-face OCT image is associated with a transverse volume slab of a given layer of tissue, e.g. retinal nerve fibre layer (RNFL), retinal pigment epithelium (RPE) or choroid.

3.1.4

manufacturer

natural or legal person with responsibility for design or manufacture of an ophthalmic instrument with the intention of making the ophthalmic instrument available for use, under their name, whether or not such an ophthalmic instrument is designed or manufactured by themselves or on their behalf by another person

[SOURCE: ISO 13485:2016, 3.10, modified — The word "medical device" has been replaced by "ophthalmic instrument" and the original notes to entry have been deleted. Text has been made gender-neutral.]

3.1.5

OCT volume

three-dimensional (spatial) representation of the results of a volume scan

Note 1 to entry: An OCT cube is a subtype of an OCT volume.

3.1.6

ophthalmic instrument

device designed to have an application to the eye, and intended by its *manufacturer* (3.1.4) to be used in the diagnosis, treatment, or monitoring of a patient, or for compensation or alleviation of disease, injury or disability

[SOURCE: ISO 15004-1:2020, 3.1]

3.1.7

optical coherence tomograph

OCT instrument

medical device or system that measures, processes, and displays OCT images of target objects

3.1.8

optical coherence tomography

OCT

optical interferometric measurement technique for obtaining cross-sectional images of a target object, using partially coherent optical radiation to determine the relative depths of backscattering structures within the object

EXAMPLE Biological tissue of the human eye is an example of a target object.

3.1.9

standard eye

emmetropic eye that has a focal length of 17 mm in air and with retinal tissue with an index of refraction of $n = 1,33$ to $n = 1,39$

Note 1 to entry: The manufacturer specifies the index of refraction.

3.1.10

structural OCT image

two-dimensional image representing the reflectance of the sample tissue along a surface

Note 1 to entry: Typically, the representation of results of one or multiple B-scans.

3.1.11

volume scan

three-dimensional sampling of the reflectance of the sample tissue

Note 1 to entry: Often realised as a sequence of spatially adjacent B-scans.

3.1.12

volume slab

slab

contiguous region of interest in an OCT volume, roughly in the form of a layer or slice

Note 1 to entry: A slab can follow an anatomical structure or can be plane. It can be as thick as the retina or as thin as a single surface.

3.2 Optical properties

3.2.1

angular field of view

FOV

angular extent from which an image can be taken, expressed as the angle subtended at the exit pupil of the eye by the maximum dimension $2r$

[SOURCE: ISO 10940:2009, 3.2, modified]

ISO 16971-1:2024

<https://standards.iteh.ai/catalog/standards/iso/8ba62d32-116e-4b84-827a-cb5f95990530/iso-16971-1-2024>
 Note 1 to entry: See [Figure 1](#).

Key

- 1 angular field of view
- 2 entrance pupil of instrument/exit pupil of eye

Figure 1 — Meaning of dimension r for various formats

3.2.2

axial range

measuring range of the OCT instrument in the axial direction in tissue in a *standard eye* ([3.1.9](#))

Note 1 to entry: This corresponds to the length of an A-scan.

Note 2 to entry: The axial range can be calculated by dividing the optical path length range by the assumed refractive index of the tissue.

3.2.3

axial resolution

full width half maximum of the OCT signal of a single punctiform reflector in axial direction, given in tissue in a standard eye

3.2.4

transverse range

transverse extent of an OCT image at the image plane in a standard eye

3.2.5

transverse optical resolution

full width at half maximum of the OCT signal of a single punctiform reflector in transverse direction, given in tissue in a standard eye

3.3 Signal characteristics

3.3.1

axial sampling density

distance between the corresponding locations in tissue for two adjacent OCT image pixels in axial direction

3.3.2

axial signal roll-off

attenuation in OCT signal with axial depth in tissue, specified by the decrease in sensitivity at a given axial location in the image window relative to the maximum sensitivity

3.3.3

sensitivity

ratio between irradiated optical power and minimum detectable optical power reflected back from the sample to the system

Note 1 to entry: Sensitivity is typically expressed in decibels.

Note 2 to entry: Sensitivity of OCT instruments is not the same as the term sensitivity used to describe clinical accuracy for clinical performance testing.

Note 3 to entry: In the OCT literature, 'sensitivity' is frequently used to denote 'maximum sensitivity.'

3.3.4

maximum sensitivity

sensitivity ([3.3.3](#)) measured at the axial depth of the greatest signal

3.3.5

minimum sensitivity

sensitivity ([3.3.3](#)) measured at the axial depth of the least signal

3.3.6

transverse sampling density

displacement of the OCT beam between neighbouring A-scans or B-scans
