

FINAL
DRAFT

INTERNATIONAL
STANDARD

ISO/IEC
FDIS
30193

ISO/IEC JTC 1/SC 23

Secretariat: JISC

Voting begins on:
2021-09-10

Voting terminates on:
2021-11-05

Information technology — Digitally recorded media for information interchange and storage — 120 mm triple layer (100,0 GB per disk) BD rewritable disk

iTeh STANDARD PREVIEW
Technologies de l'information — Supports enregistrés numériquement pour échange et stockage d'information — Disques BD réinscriptibles de 120 mm triple couche (100,0 Go par disque)
(standards.iteh.ai)

[ISO/IEC FDIS 30193](#)

RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document is in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html.

ITECH STANDARD PREVIEW (standards.itech.ai)

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 23, *Digitally recorded media for information interchange and storage*.
<https://standards.itech.ai/catalog/standards/sist/796dfe71-7c4e-44e8-b43e-051168711802>

This fourth edition cancels and replaces the third edition (ISO/IEC 30193:2020), which has been technically revised. It also incorporates the Amendment ISO 30193:2021/DAmd1.

The main changes compared to the previous edition are as follows:

- The missing condition of pulse width regarding residual errors has been added.
- The editorial errors amendments for ISO/IEC 30190 to ISO/IEC 30192 have been applied.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

In March 2002, the Blu-ray Disc Founders (BDF) came together to create optical-disk formats with large capacity and high-speed transfer rates that would be needed for recording and reproducing high-definition video content. This joint effort turned out to be fruitful and the first version of its Blu-ray Disc^{TM1)} Rewritable format Part 1 version 1.0, with cartridge, was issued in June 2002.

The Blu-ray Disc Association (BDA) issued version 2.1 of the Blu-ray DiscTM rewritable format Part 1 in October 2005 and version 3.0, without cartridge, in June 2010.

To maintain compatibility of the removable medium in the market, a standard alone is not enough. It is necessary to check that the disks and devices can satisfy the specifications. The BDA also conducts verification activities for both disks and devices and has established more than 10 testing centers in Asia, Europe and the USA.

Blu-rayTM disks, players, recorders and PC drives/software based on BDA standards became popular all over the world. The BDA gave consumer applications the highest priority in the first few years. But it was known, of course, that international standardization would be required before many government entities and their contractors would be allowed to use Blu-ray DiscTM. In January and February 2011, the chairs of ISO/IEC JTC 1/SC 23 and JIIMA (Japan Image and information Management Association) formally requested the BDA to consider international standardization. The reason for this was to enable the inclusion of writable BDs along with DVDs and CDs in an international standard specifying the test methods for the estimation of a lifetime of optical storage media for long-term data storage. In October 2011, the President of the BDA responded that the organization had decided to pursue international standardization for the basic physical formats for the recordable and rewritable Blu-rayTM formats.

In December 2011, the BDA sent project proposals for international standardization of four formats to ISO/IEC JTC 1/SC 23 via the Japanese national body. They are 120 mm single layer (25,0 GB per disk) and dual layer (50,0 GB per disk) BD recordable disks, 120 mm single layer (25,0 GB per disk) and dual layer (50,0 GB per disk) BD rewritable disks, 120 mm triple layer (100,0 GB per disk) and quadruple layer (128,0 GB per disk) BD recordable disks and 120 mm triple layer (100,0 GB per disk) BD rewritable disk.

This document specifies the mechanical, physical and optical characteristics of a 120 mm rewritable optical disk with a capacity of 100,0 GB.

A few additional specifications are required in order to write and read video-recording applications, such as BDAV format which had been specified by the BDA for use on BD rewritable disks. These specifications, which are related to the BD application (BDAP), the file system or the content-protection system, are required for the disk, the generating system and the receiving system. For more information about the BDAP, the content-protection system and the additional requirements for the Blu-rayTM format specifications, see <http://www.blu-raydisc.info>.

The International Organization for Standardization (ISO) and International Electrotechnical Commission (IEC) draw attention to the fact that it is claimed that compliance with this document may involve the use of a patent.

ISO and IEC take no position concerning the evidence, validity and scope of this patent right.

The holder of this patent right has assured ISO and IEC that he/she is willing to negotiate licences under reasonable and non-discriminatory terms and conditions with applicants throughout the world. In this respect, the statement of the holder of this patent right is registered with ISO and IEC. Information may be obtained from the patent database available at www.iso.org/patents.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights other than those in the patent database. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

¹⁾ Blu-rayTM and Blu-ray DiscTM are the trademark of products supplied by Blu-ray Disc Association. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of the product named.

Information technology — Digitally recorded media for information interchange and storage — 120 mm triple layer (100,0 GB per disk) BD rewritable disk

1 Scope

This document specifies the mechanical, physical and optical characteristics of a 120 mm rewritable optical disk with a capacity of 100,0 GB. It specifies the quality of the recorded and unrecorded signals, the format of the data and the recording method, thereby allowing for information interchange by means of such disks. User data can be written, read and overwritten many times using a reversible method. This disk is identified as a BD rewritable disk.

This document specifies the following:

- the one disk type;
- the conditions for conformance;
- the environments in which the disk is to be operated and stored;
- the mechanical and physical characteristics of the disk, in order to provide mechanical interchange between data processing systems; (**iTeh STANDARD REVIEW standards.iteh.ai**)
- the format of the information on the disk, including the physical disposition of the tracks and sectors;
- the error-correcting codes and the ISO/IEC FDIS 30193 used;
<https://standards.iteh.ai/catalog/standards/sist/796dfc71-7c4e-44e8-b43e-52687168c615#s1.23>
- the characteristics of the signals recorded on the disk, enabling data processing systems to read data from the disk.

This document provides for interchange of disks between disk drives. Together with a standard for volume and file structure, it provides for full data interchange between data processing systems.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO/IEC 646, *Information technology — ISO 7-bit coded character set for information interchange*

ISO 9352, *Plastics — Determination of resistance to wear by abrasive wheels*

IEC 60068-2-2, *Environmental testing — Part 2-2: Tests — Test B: Dry heat*

IEC 60068-2-30, *Environmental testing — Part 2-30: Tests — Test Db: Damp heat, cyclic (12 h + 12 h cycle)*

IEC 60950-1, *Information technology equipment — Safety — Part 1: General requirements*

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1

BD

disk having a *cover layer* (3.4) around 0,1 mm thick and a *substrate* (3.43) around 1,1 mm thick on which data is read or recorded by an optical pick-up unit (OPU) using 405 nm laser diode and numerical aperture, NA = 0,85 lens

Note 1 to entry: User data recorded on a disk is formatted using 17PP modulation and an LDC+BIS Code.

3.2

BD application

BDAP

contents standard specified for a *BD* (3.1), e.g. a video application, which requires area for a content-protection system and for its own defect-management system on the disk

3.3

channel bit

cbs

element by which the binary value ZERO or ONE is represented by *pits* (3.27), *marks* (3.19) and *spaces* (3.42) on a disk

iTeh STANDARD PREVIEW (standards.iteh.ai)

3.4

cover layer

transparent layer with precisely controlled optical properties that covers the *recording layer* (3.33) closest to the *entrance surface* (3.10) of a disk

[ISO/IEC FDIS 30193](#)

3.5

data zone n

<https://standards.iteh.ai/catalog/standards/sist/796dfc71-7c4e-44e8-b43e-a5c536817c6f/iso-iec-fdis-30193>

area between the inner zone and the outer zone on *layer Ln* (3.17)

3.6

defective cluster

cluster in a *user-data area* (3.47) that has been registered in a defect list as unreliable or uncorrectable

3.7

DSV

digital-sum value

arithmetic sum obtained from a bit stream by assigning the decimal value +1 to *channel bits* (3.3) set to ONE and the decimal value -1 to channel bits set to ZERO

3.8

disk reference plane

plane defined by the perfect flat annular surface of an ideal spindle, onto which the clamping zone of a disk is clamped, that is normal to the axis of rotation

3.9

embossed HFM area

area on a disk where information has been stored by means of an *HFM groove* (3.13) during manufacturing of the disk

3.10

entrance surface

surface of a disk onto which the optical beam first impinges

3.11**erased groove**

blank *groove* (3.12) on a disk that has been erased by irradiating the *track* (3.44) using only erase power level, P_{E0} , as determined by the OPC algorithm

3.12**groove**

trench-like feature of a disk connected to a *recording layer* (3.33)

Note 1 to entry: In case of triple-layer disk, one groove can be carried by the *substrate* (3.43) and other grooves can be carried by the *spacer layer* (3.41) or the *cover layer* (3.4) (see [Figure 1](#)) grooves are used to define the *track* (3.44) locations.

In the BD rewritable system, there are 3 types of grooves:

- *wobbled groove* (3.49) in rewritable area containing address information;
- *HFM groove* (3.13) in *embossed HFM area* (3.9) containing permanent information and control data;
- straight groove without any modulation in the BCA zone.

3.13**HFM groove****high-frequency modulated groove**

groove (3.12) modulated in the radial direction with a rather high bandwidth signal

Note 1 to entry: HFM groove creates a data channel with sufficient capacity and data rate for replicated information.

(standards.iteh.ai)**3.14****information area**

area on a disk in which information can be recorded

<https://standards.iteh.ai/catalog/standards/sist/796dfe71-7c4e-44e8-b43e-a5c536817c6f/iso-iec-fdis-30193>

3.15**information zone**

recorded part of the *information area* (3.14)

3.16**land**

surface of a *recording layer* (3.33) between successive windings of a *groove* (3.12)

3.17**layer Ln**

one *recording layer* (3.33) of a disk identified by n

Note 1 to entry: layer L($n+1$) is closer to the *entrance surface* (3.10) of a disk than layer Ln.

3.18**layer type**

identification of a disk using the number of layer(s)

Note 1 to entry: In case of triple-layer disk, the layer type is TL (see [Clause 7](#)).

3.19**mark**

feature of a *recording layer* (3.33), which can take the form of an amorphous domain in the crystalline recording stack due to recording, that can be sensed by an optical read-out system

Note 1 to entry: The pattern of marks and spaces (3.42) represents the data on a disk.

3.20**mark polarity**

polarity of reflectivity change when *marks* (3.19) are recorded

3.21

measurement velocity

linear velocity at which a disk is measured during reading

Note 1 to entry: The nx measurement velocity means the measurement velocity of n times the *reference velocity* ([3.36](#)).

3.22

modulation bit

alternative form representing the data, that is more suited to be transmitted via a communication channel or to be stored on a storage system

3.23

NRZI conversion

method of converting modulation-bit stream into a physical signal

3.24

on-groove

geometry where *grooves* ([3.12](#)) are nearer to the *entrance surface* ([3.10](#)) of a disk than the *lands* ([3.16](#))

3.25

padding

process in a drive to fill up the missing sectors in a 64K cluster, which consists of 32 *sectors* ([3.40](#)), with all 00h data when the host supplies less than the 32 sectors and needs to fill up the cluster

3.26

iTeh STANDARD PREVIEW

phase change
physical effect by which an area of a *recording layer* ([3.33](#)) is irradiated by a laser beam and heated in order to change from a crystalline state to an amorphous state and vice versa

3.27

[ISO/IEC FDIS 30193](#)

pit

<https://standards.iteh.ai/catalog/standards/sist/796dfe71-7c4e-44e8-b43e->

feature of a *recording layer* ([3.33](#)), which can take the form of a depression in or elevation on the *land* ([3.16](#)) surface, that can be sensed by the optical read-out system

Note 1 to entry: The pattern of pits and spaces ([3.42](#)) represents the data on a disk.

3.28

polarization

direction of the electric field vector of an optical beam

Note 1 to entry: The plane of polarization is the plane containing the electric field vector and the direction of propagation of the beam.

3.29

pre-recorded area

area on a disk where information has been recorded by the manufacturer/supplier of the disk by applying standard recording techniques after finishing of the replication process

3.30

protective coating

optional additional layer on top of the *cover layer* ([3.4](#)) provided for extra protection against scratches and other types of damage

3.31

reading velocity

linear velocity at which a disk is actually read

Note 1 to entry: The nx reading velocity means the reading velocity of n times the *reference velocity* ([3.36](#)).

3.32**read-modify-write****R-M-W**

process in a drive to read full content of a 64K cluster, which consists of 32 sectors (3.40), replace the sector(s) concerned and write back the full cluster to a disk when one or more, but less than 32, sector(s) in a cluster is(are) rewritten

3.33**recording layer**

part of a disk consisting of a stack of films of specific materials on or in which data is written during manufacture and/or use

3.34**reference servo**

servomechanism of a reference drive with parameters defined for measuring disks

3.35**recording velocity**

linear velocity at which a disk is recorded

Note 1 to entry: The n x recording velocity means the recording velocity of n times the *reference velocity* (3.36).

3.36**reference velocity**

linear velocity that results in the nominal channel-bit rate of 66 000 Mbit/s

iTeh STANDARD PREVIEW (standards.iteh.ai)

3.37**reserved**

<value> value(s) not used in this document

3.38**reserved**

<https://standards.iteh.ai/catalog/standards/sist/796dfc71-7c4e-44e8-b43e->

<field> field(s) not specified in use, to be ignored in interchange and to be set to ZERO as value

[ISO/IEC FDIS 30193](#)

3.39**rewritable area**

area on a disk where information can be recorded by means of *marks* (3.19) and *spaces* (3.42) using the phase-change effect and during the manufacture and/or use of the disk

3.40**sector**

minimum-size addressable data part of a *track* (3.44) in the *information zone* (3.15)

3.41**spacer layer**

transparent layer with precisely-controlled optical properties separating two *recording layers* (3.33)

3.42**space**

area separating *pits* (3.27) or *marks* (3.19) in the tangential direction in the context of HF signals

Note 1 to entry: The pattern of *pits* (3.27), *marks* (3.19) and spaces represents the data on a disk.

3.43**substrate**

layer, which can be transparent or not, provided for the mechanical support of a *recording layer* (3.33)

3.44**track**

360° turn of a continuous spiral, formed by a *groove* (3.12)
