RECIPIENTS OF THIS DRAFT ARE INVITED TO SUBMIT, WITH THEIR COMMENTS, NOTIFICATION OF ANY RELEVANT PATENT RIGHTS OF WHICH THEY ARE AWARE AND TO PROVIDE SUPPORTING DOCUMENTATION.

IN ADDITION TO THEIR EVALUATION AS BEING ACCEPTABLE FOR INDUSTRIAL, TECHNOLOGICAL, COMMERCIAL AND USER PURPOSES, DRAFT INTERNATIONAL STANDARDS MAY ON OCCASION HAVE TO BE CONSIDERED IN THE LIGHT OF THEIR POTENTIAL TO BECOME STANDARDS TO WHICH REFERENCE MAY BE MADE IN NATIONAL REGULATIONS.

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 269, *Railway applications*, Subcommittee SC 2, *Rolling stock*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

ISO/FDIS 10516

Introduction

This document provides a set of vehicle reference masses and describes how each is derived. These reference masses can be used as a clear and unique specification of the load conditions of rail vehicles in relation to dimensioning, design, testing, acceptance, marking, delivery, operation, maintenance, etc. This document does not specify for which cases a defined reference mass is applied. The determination of how these reference masses are applied is governed by the corresponding application standards or specifications.

The reference masses are determined from the parameters described in the document (see [5.1](#)), and their default values. If the default values are not applicable for certain vehicles, specific reference masses may, where justified, be chosen from a range of values given in brackets. The corresponding vehicle specification identifies where specific values are used instead of default values. In this sense, the reference masses, whether based on default values or on specific values, are consistent for all applications which use them.

This document does not supersede mass definitions in application standards. As such, application standards can provide their own mass definitions (special purpose masses). To align these mass definitions in application standards, such special purpose mass definitions should stay within the framework of the specifications described in this document.

Railway applications — Vehicle reference masses

1 Scope

This document provides reference masses for specifying the requirements for rail vehicles.

These reference masses are specified with respect to the whole vehicle, but they can also be applicable to a specific system or component.

This document does not supersede mass or payload conditions which are specified in application standards.

This document is applicable for all types of rail vehicles.

2 Normative references

There are no normative references in this document.

3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at <https://www.iso.org/obp>
- IEC Electropedia: available at <https://www.electropedia.org/>

3.1 mass increment

quantity added to or subtracted from the vehicle mass

EXAMPLE *Payload (3.2), staff, consumables, wear allowance (3.10).*

3.2 payload

mass increment (3.1) for the load carried by the vehicle (passengers, luggage or cargo)

Note 1 to entry: This is typically a load from which revenue is derived.

3.3 luggage compartment

closed area that is intended for the carriage of luggage and goods, and not for the transport of passengers

3.4 luggage area

low-level location or unit in a passenger saloon or vestibule provided to store luggage

Note 1 to entry: Overhead luggage racks are not regarded as luggage areas.

3.5 passenger area

dedicated area inside the vehicle for transporting passengers

Note 1 to entry: *Catering areas (3.6)* are not regarded as passenger areas.

3.6

catering area

area set aside for passengers for the purchase or consumption of catering services

EXAMPLE Buffet, bar, bistro.

3.7

standing area

unobstructed part of either a *passenger area* (3.5) or a *catering area* (3.6) which can be used by standing passengers

EXAMPLE Vestibules, aisles, stairways.

3.8

normal seat

permanent seat in a *passenger area* (3.5) or *catering area* (3.6)

3.9

tip-up seat

folding seat fixed to a wall or partition for temporary use

3.10

wear allowance

quantity of mass that is assumed to be lost in service due to abrasion and mechanical wear

Note 1 to entry: The main sources of wear to be accounted for are from wheels and brake friction materials.

3.11

dead mass

mass of the vehicle in the "as built" condition without consumables and without staff

Note 1 to entry: See 5.3 for further information.

3.12

working order

condition in which the vehicle is available for service, including staff and an amount of consumables, but without any *payload* (3.2)

Note 1 to entry: The amount of consumables depends on the vehicle condition [*design condition* (3.15) or *operational condition* (3.16)] as given in Table 4.

Note 2 to entry: This state is sometimes described as "unladen" or "tare". Nevertheless, the use of the expression "working order" is encouraged to harmonize wording.

3.13

normal payload

typical *payload* (3.2) seen on a regular basis

Note 1 to entry: The normal payload depends on the vehicle condition (design or operational condition) as given in Table 2.

Note 2 to entry: For freight vehicles, the payload is always taken as the maximum payload as specified in the loading table of the vehicle.

3.14

exceptional payload

maximum possible *payload* (3.2) that can be carried

Note 1 to entry: The exceptional payload represents the design limit for operation of the vehicle and is only defined for the design condition (see also Table 2).

3.15

design condition

theoretical state for analysis and calculation

3.16

operational condition

assumed average state when in service

3.17

application standard

standard which makes use of the provisions given in this document

3.18

special purpose mass

mass, specified in an *application standard* (3.17), which is based on the reference mass or *payload* (3.2) state definitions specified in this document

Note 1 to entry: In accordance with this definition, a reference mass or payload state as defined in this document, which is used without modification by an application standard, is not considered as a special purpose mass.

Note 2 to entry: See 5.6 for detailed information about the mass definitions in application standards.

3.19

default value

nominal parameter which is used as the basis for the determination of reference masses

Note 1 to entry: In Table A.1, Table A.2 and Table A.3, the default values are given without brackets.

3.20

particular value

alternative parameter within certain limitations which is used as the basis for the determination of reference masses

Note 1 to entry: In Table A.1, Table A.2 and Table A.3, the limitations for particular values are given within brackets.

3.21

vehicle specification

document stating technical vehicle requirements

Note 1 to entry: The vehicle specification typically forms part of the contractual relationship between the manufacturer and the operator.

4 Symbols

The symbols used throughout this document are derived as follows:

Symbol Definition

m	total vehicle mass
$m_{D,N}$	design mass under normal payload
$m_{O,N}$	operational mass under normal payload
m_U	dead mass
$m_{D,V}$	design mass in working order
$m_{O,V}$	operational mass in working order
$m_{D,X}$	design mass under exceptional payload
Δm	mass increment (payload, consumables, staff, wear allowance)
Δm_{DC}	mass increment for the design consumables

Δm_{OC}	mass increment for the operational consumables
Δm_{ND}	mass increment for the normal design payload
Δm_{NO}	mass increment for the normal operational payload
Δm_{XD}	mass increment for the exceptional payload

Further provisions concerning symbols are given in [Annex B](#). Historically used abbreviated terms are listed in [Annex C](#).

5 Calculation of vehicle reference masses

5.1 General

This document specifies methods for calculating reference masses including default values and particular values for payloads.

To determine a reference mass, the following parameters are required:

- applicable vehicle category (see [5.2](#));
- applicable mean population mass level (see [Annex A](#));
- applicable payload state (see [5.4](#)); and
- condition required:
 - design condition; or
 - operational condition.

These parameters are specified in the relevant vehicle specification and application standard(s).

Tolerances to the reference masses can be given in application standards or in the vehicle specification.

NOTE Certain applications can require reference masses to be evaluated and then place tolerances on those individual values.

Within the framework of reference masses described in this document it is permissible to deviate from the default values and specify particular values within the ranges given in [Annex A](#). If particular values are to be used, then they shall be provided in the vehicle specification.

In specifying particular values for determining reference masses, consideration should be given to:

- consistency between payload states. For example, if the mass per square metre is modified for an exceptional payload, the value to be used for normal payload can potentially also require modification;
- ensuring that any reference mass is applied consistently to applicable system components (for example vehicle body loads and bogie loads).

EXAMPLE A particular value for standing areas of 420 kg/m² at $\Delta m_{ND}(420)$ is inconsistent with a particular value for standing areas of 350 kg/m² at $\Delta m_{XD}(350)$.

In consideration of the climatic conditions and operating environment where the vehicle is intended to be used, it can be necessary to include additional loads (for example snow and ice build-up on running gear and underframes or rainwater absorbed by wooden freight wagon floors) with the reference masses. Any environmental loads to be considered shall form part of the vehicle specification.
