This document is not an ASTM standard and is intended only to provide the user of an ASTM standard an indication of what changes have been made to the previous version. Because it may not be technically possible to adequately depict all changes accurately, ASTM recommends that users consult prior editions as appropriate. In all cases only the current version of the standard as published by ASTM is to be considered the official document.

Designation: B763 - 12 B763 - 13

Standard Specification for Copper Alloy Sand Castings for Valve Applications¹

This standard is issued under the fixed designation B763; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

1. Scope*

1.1 This specification establishes requirements for copper alloy sand castings for valve applications. Nominal compositions of the alloys defined by this specification are shown in Table $1.^2$

NOTE 1—This specification does not cover Copper Alloy UNS Nos. C83600, C92200, C96200, and C96400. These alloys are also used in valve applications. They are covered by the following specifications:

C83600: B62 C92200: B61 C96200: B369 C96400: B369

1.2 The castings produced under this specification are used in products which may be manufactured in advance and supplied for sale from stock by the manufacturer.

1.3 Units—The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

2. Referenced Documents

2.1 ASTM Standards:³

B61 Specification for Steam or Valve Bronze CastingsSTM B763-13

B62 Specification for Composition Bronze or Ounce Metal Castings

B208 Practice for Preparing Tension Test Specimens for Copper Alloy Sand, Permanent Mold, Centrifugal, and Continuous Castings

B369 Specification for Copper-Nickel Alloy Castings

B824 Specification for General Requirements for Copper Alloy Castings

E10 Test Method for Brinell Hardness of Metallic Materials

E527 Practice for Numbering Metals and Alloys in the Unified Numbering System (UNS)

3. General Requirements

3.1 The following sections of Specification B824 form a part of this specification.

3.1.1 Terminology,

- 3.1.2 Other Requirements,
- 3.1.3 Dimensions, Mass, and Permissible Variations,

3.1.4 Workmanship, Finish, and Appearance,

*A Summary of Changes section appears at the end of this standard

¹ This specification is under the jurisdiction of ASTM Committee B05 on Copper and Copper Alloys and is the direct responsibility of Subcommittee B05.05 on Castings and Ingots for Remelting.

Current edition approved April 1, 2012 April 1, 2013. Published May 2012 April 2013. Originally approved in 1986. Last previous edition approved in 20082012 as B763 - 08a; B763 - 12. DOI: 10.1520/B0763-12:10.1520/B0763-13.

 $^{^{2}}$ The UNS system for copper and copper alloys (see Practice E527) is a simple expansion of the former standard designation system accomplished by the addition of a prefix "C" and a suffix "00". The suffix can be used to accommodate composition variations of the base alloy.

- 3.1.15 Packaging and Package Marking, and
- 3.1.16 Supplementary Requirements.

4. Ordering Information

4.1 Include the following information when placing orders for product under this specification, as applicable:

4.1.1 Specification title, number, and year of approval,

- 4.1.2 Quantity of castings,
- 4.1.3 Copper Alloy UNS Number and temper (as-cast, heat-treated, etc.),

4.1.4 Pattern or drawing number and condition (as-cast, machined, etc.),

4.1.5 When castings are purchased for agencies of the U.S. Government, the Supplementary Requirements of Specification B824 may be specified.

🎐 B763 – 13

4.2 The following requirements are optional and should be specified in the purchase order when required.

- 4.2.1 Chemical analysis of residual elements (6.3),
- 4.2.2 Pressure test or soundness requirements (Specification B824),
- 4.2.3 Approval of weld repair and records of repair (Section 10),
- 4.2.4 Certification (Specification B824),
- 4.2.5 Foundry test report (Specification B824),
- 4.2.6 Witness inspection (Specification B824),
- 4.2.7 Product marking (Specification B824),
- 4.2.8 Castings for seawater service (5.1).

5. Materials and Manufacture

5.1 For better corrosion resistance in sea water applications, castings in Copper Alloy UNS No. C95800 shall be given a temper anneal heat treatment at $1250 \pm 50^{\circ}$ F (675 $\pm 10^{\circ}$ C) for 6-h minimum. Cooling shall be by the fastest means possible that will not cause excessive distortion or cracking.

5.2 Copper Alloy UNS Nos. C94700, C95300, C95400, C95410, and C95500 may be supplied in the heat-treated condition to obtain the higher mechanical properties shown in Table 4. Suggested heat treatments for these alloys and copper alloy UNS No. C95520 are given in Table 5. Actual practice may vary by manufacturer.

5.3 Separately cast test bar coupons representing castings made in Copper Alloy UNS Nos. C94700HT, C95300HT, C95400HT, C95410HT, and C95500HT shall be heat treated with the castings.

6. Chemical Composition

6.1 The castings shall conform to the requirements for major elements shown in Table 2.

6.2 These specification limits do not preclude the presence of other elements. Limits may be established and analysis required for unnamed elements agreed upon between the manufacturer or supplier and the purchaser. Copper or zinc may be given as remainder and may be taken as the difference between the sum of all elements analyzed and 100 %. When all named elements in Table 2 are analyzed, their sum shall be as specified in Table 3.

6.3 It is recognized that residual elements may be present in cast copper alloys. Analysis shall be made for residual elements only when specified in the purchase order.

7. Mechanical Properties

<u>ASTM B763-13</u>

7.1 Mechanical properties shall be determined from separately cast test bars, and shall conform with the requirements shown

in Table 4.

8. Sampling

8.1 Copper Alloy UNS Nos. C86200, C86300, C86400, C86500, C86700, C95200, C95300, C95400, C95410, C95500, C95600, C95800, C99400, and C99500 test bar castings shall be cast to the form and dimensions shown in Figs. 1 or 2 of Practice B208. For all other alloys listed in this specification test bars shall be cast to the form and dimensions shown in Figs. 2, 3 or 4 of Practice B208.

9. Test Methods

9.1 Analytical chemical methods are given in Specification B824 (Test Methods section).

9.2 Brinell hardness readings, if specified on the purchase order, shall be taken in the grip end of the tension test bar and shall be made in accordance with Test Method E10, except that a 3000-kg load shall be used.

10. Casting Repair

10.1 Copper Alloy UNS Nos. C95200, C95300, C95400, C95410, C95500, C95600, and C95800 included in this specification are generally weldable. Weld repairs may be made at the manufacturer's discretion provided each excavation does not exceed 20 % of the casting section or wall thickness or 4 % of the casting surface area.

10.2 Excavations that exceed those described in 10.1 may be made at the manufacturer's discretion except that when specified in the ordering information (4.2.3), the weld procedure shall be approved by the purchaser and the following records shall be maintained:

10.2.1 A sketch or drawing showing the dimensions, depth, and location of excavations,

10.2.2 Post-weld heat treatment, when applicable,
