Designation: ~~F2989 – 12~~ F2989 – 13

Standard Specification for Metal Injection Molded Unalloyed Titanium Components for Surgical Implant Applications[1]

This standard is issued under the fixed designation F2989; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers the chemical, mechanical, and metallurgical requirements for three grades of metal injection molded (MIM) unalloyed titanium components in two types to be used in the manufacture of surgical implants.

1.2 The Type 1 MIM components covered by this specification may have been densified beyond their as-sintered density by post-sinter processing.

1.3 Values in either inch-pound or SI are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore each system shall be used independent of the other. Combining values from the two systems may result in non-conformance with the specification.

1.4 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

Standard 63 Density Determinations of MIM Components (Gas Pycnometry)
Standard 64 Terms Used in Metal Injection Molding

3. Terminology

3.1 Definitions of powder metallurgy and MIM terms can be found in Terminology B243 and MPIF Standard 64. Additional descriptive information is available in the Related Material Section of Vol. 02.05 of the *Annual Book of ASTM Standards*.

3.2 The materials produced by means of the metal injection molding process are designated by the prefix, "MIM", followed by the appropriate designation for the alloy grade. The MIM designates that it was made by metal injection molding.

3.3 *Definitions of Terms Specific to This Standard:*

3.3.1 *absolute density, n*—the value of density used to characterize a powder material with a particular chemical composition as if it were a fully dense material, completely free of porosity.

3.3.1.1 *Discussion*—

For the purposes of this specification, the skeletal density (also referred to as pycnometer density) measured on the raw material powders using the pycnometry method of Test Method B923 shall be used to represent the absolute density of the particular chemical composition.

3.3.2 *debinding, v*—a step between molding and sintering where the majority of the binder used in molding is extracted by heat, solvent, a catalyst, or other techniques.

3.3.3 *feedstock, n—in metal injection molding*, a moldable mixture of metal powder and binder.

3.3.4 *feedstock batch, n*—a specified quantity of feedstock made up of the same lot of metallic powders and the same lot of binder materials mixed under the same conditions at essentially the same time.

3.3.5 *lot, n*—a specified quantity of components made up of the same batch of feedstock, debound, sintered, and post-processed under the same conditions at essentially the same time.

3.3.6 *metal injection molded component, n*—product fabricated by a metal injection molding process consisting of mixing metal powders with binders to make a feedstock, introducing this feedstock into a mold by injection or other means, debinding to remove the binders, and sintering.

3.3.7 *near net component, n*—a component that meets dimensional tolerance as built with little post processing.

3.3.8 *net component, n*—a component that meets dimensional tolerance as built with no post processing.

3.3.9 *pre-alloyed powder, n*—powder composed of two or more elements that are alloyed in the powder manufacturing process in which the particles are of the same nominal composition throughout.

3.3.10 *relative density, n*—the density ratio, often expressed as a percentage, of the density of a porous material to the absolute density of the same material, completely free of porosity.

3.3.11 *sintering, v*—the metallurgical bonding of particles in a MIM component resulting from a thermal treatment at a temperature below the melting point of the main constituent.

3.3.12 *Type 1, n*—a MIM component that may have been desified beyond its as-sintered density by post-sinter processing.

3.3.13 *Type 2, n*—a MIM component that shows the as-sintered density and was not densified after sintering.

4. Ordering Information

4.1 Include with inquiries and orders for material under this specification the following information:
4.1.1 Quantity,

4.1.2 ASTM specification and date of issue,
4.1.3 Grade (MIM 1, MIM 2 or MIM 3),
4.1.4 Type (1 or 2),
4.1.5 Units to be certified—SI or Inch-Pounds,
4.1.6 Component configuration (engineering drawing or 3D solid model, or both) and dimensional requirements,
4.1.7 Condition (5.2),
4.1.8 Mechanical properties (if applicable),
4.1.9 Finish (5.2),
4.1.10 Special tests (9, 10 and 11), if any, and
4.1.11 Other requirements.

5. Materials and Manufacture

5.1 Components conforming to this specification shall be produced by the metal injection molding process using unalloyed metal powders with major elemental composition meeting the chemical requirements of Table 1.

5.2 Post-sintering operations may be employed to achieve the desired density, shape, size, surface finish, or other component properties. The post-sintering operations shall be agreed upon between the supplier and purchaser.

5.3 The condition and finish of the components shall be agreed upon between the supplier and purchaser.

6. Chemical Requirements

6.1 The components supplied under this specification shall conform to the chemical requirements in Table 1. The supplier shall not ship components with chemistry outside the requirements specified in Table 1.

6.2 Chemical analysis of the finished component or a representative sample shall be used for reporting all chemical requirements. Any representative sample shall be produced from the same feedstock batch, debound, sintered, and post processed concurrently with the finished components that it represents.

6.2.1 Requirements for the major and minor elemental constituents are listed in Table 1. Also listed are important residual elements. The percentage of titanium is determined by difference and need not be determined or certified.

6.2.2 Intentional elemental additions other than those specified in Table 1 are not permitted.

6.2.3 Analysis for elements not listed in Table 1 is not required to verify compliance with this specification.

6.3 *Product Analysis:*

6.3.1 Product analysis tolerances do not broaden the specified heat analysis requirements but cover variations in the measurement of chemical content between laboratories. The product analysis tolerances shall conform to the product tolerances in Table 2.

6.3.2 The product analysis is either for the purpose of verifying the composition of the manufacturing lot or to determine variations in the composition within the lot. Acceptance or rejection of the manufacturing lot of components may be made by the purchaser on the basis of this product analyses.

6.3.3 Samples for chemical analysis shall be representative of the component being tested. The utmost care shall be used in sampling titanium for chemical analysis because of its affinity for elements such as oxygen, nitrogen, and hydrogen. In cutting samples for analysis, therefore, the operation should be carried out insofar as possible in a dust-free atmosphere. Cutting tools should be clean and sharp. Samples for analysis should be stored in suitable containers.

6.3.4 Product analysis outside the tolerance limits allowed in Table 2 is cause for rejection of the product. A referee analysis may be used if agreed upon by the supplier and purchaser.

6.3.5 For referee purposes, use Test Methods E539, E1409, E1447, E1941, and E2371 and Guide E2626 or other analytical methods agreed upon between the purchaser and the supplier.

7. Mechanical Requirements

7.1 *Tensile Properties:*

7.1.1 The components supplied under this specification shall conform to the mechanical property requirements in Table 3.

TABLE 1 Chemical Composition

Composition for both Type 1 and Type 2 Composition, % (mass/mass)			
Element	Grade MIM 1	Grade MIM 2	Grade MIM 3
Nitrogen, max	0.03	0.03	0.05
Carbon, max	0.08	0.08	0.08
Hydrogen, max	0.015	0.015	0.015
~~Iron, max~~	~~0.020~~	~~0.030~~	~~0.030~~
Iron, max	0.20	0.30	0.30
Oxygen, max	0.18	0.25	0.30
