Designation: E617 – 13

Standard Specification for Laboratory Weights and Precision Mass Standards[1]

This standard is issued under the fixed designation E617; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This specification covers weights and mass standards used in laboratories, specifically classes 000, 00, 0, 1, 2, 3, 4, 5, 6 and 7. This specification replaces National Bureau of Standards Circular 547, Section 1, which is out of print.

1.2 This specification contains the principal physical characteristics and metrological requirements for weights that are used.

1.2.1 For the verification of weighing instruments;

1.2.2 For the calibration of weights of a lower class of accuracy; and

1.2.3 With weighing instruments.

1.3 Maximum Permissible Errors (formerly tolerances) and design restrictions for each class are described in order that both individual weights or sets of weights can be chosen for appropriate applications.

1.4 The values stated in SI units are to be regarded as standard.

1.5 Weight manufacturers must be able to provide evidence that all new weights comply with specifications in this standard (e.g., material, density, magnetism, surface finish, mass values, uncertainties). Statements of compliance by calibration laboratories during subsequent calibrations must meet the requirements of ISO/IEC 17025, 5.10.4.2 and indicate on the calibration report which sections have or have not been assessed.

3. Terminology

3.1 *Definitions of Terms Specific to This Standard:*

3.1.1 *accuracy class of weights*—a class of weights that meets certain metrological requirements intended to keep the errors within specified limits.

3.1.2 *balance*—instument indicating apparent mass that is sensitive to the following forces:

[1] This specification is under the jurisdiction of ASTM Committee E41 on Laboratory Apparatusand is the direct responsibility of Subcommittee E41.06 on Weighing Devices.

Current edition approved May 1, 2013. Published July 2013. Originally approved in 1978. Last previous edition approved in 2008 as E617 – 97 (2008). DOI: 10.1520/E0617-13.

$F_g = m \cdot g$	Force due to gravity
$F_b = v \cdot \rho_a \cdot g = \frac{m}{\rho} \rho_a \cdot g$	Air buoyancy equal to the weight of the displaced air.
$F_z = \mu_o \int\int_v \int (M + \chi H) \frac{\partial H}{\partial z} dV$	Vertical component of the magnetic interaction between the weight and the balance or the environment, or both.

H and *M* are vectors; *z* is the vertical cartesian coordinate. If magnetic effects are negligible, i.e. the permanent magnetization (*M*) of the weight and the magnetic susceptibility (χ) are sufficiently small, and the balance is calibrated with reference weights of well-known mass, the balance can be used to indicate the conventional mass, m_c, of a body under conventionally chosen conditions.

3.1.3 *calibration (of weights)*—the acts of determining the mass difference between a standard of known mass value and an "unknown" test weight or set of weights, establishing the mass value and conventional mass value of the "unknown," and of determining a quantitative estimate of the uncertainty to be assigned to the stated mass or conventional mass value of the "unknown," or both, and providing metrological traceability to the "unknown."

3.1.3.1 *calibration (generally)*—set of operations that establish, under specified conditions, the relationship between values of quantities indicated by a measuring instrument or measuring system, or values represented by a material measure or a reference material, and the corresponding values realized by standards.

3.1.4 *calibration certificate*—certificate issued by calibration laboratories to document the results of a calibration.

3.1.5 *conventional mass*—conventional value of the result of weighing in air, in accordance to International Recommendation OIML D 28. For a weight taken at 20°C, the conventional mass is the mass of a reference weight of a density of 8000 kg/m^3 which it balances in air of density of 1.2 kg/m^3.

3.1.6 *correction*—mass values are traditionally expressed by two numbers, one being the nominal mass of the weight, and the second being a correction. The mass of the weight is the assigned nominal value plus the assigned correction. Positive corrections indicate that the weight embodies more mass than is indicated by the assigned nominal value. Negative corrections indicate that the weight embodies less mass than is indicated by the assigned nominal value. The correction is equivalent to the "error."

3.1.7 *international prototype kilogram*—the platinum-iridium cylinder maintained at the International Bureau of Weights and Measures (BIPM), at Sevres, France with an internationally accepted defined mass of 1 kg.

3.1.8 *magnetism*—effect that generates an attractive or repulsive force.

3.1.8.1 *(volume) magnetic susceptibility (χ)*—measure of the ability of a medium to modify a magnetic field. It is related to the magnetic permeability (μ) by the relation: $\mu/\mu_0 = 1 + \chi$. The quantity μ/μ_0 is sometimes referred to as the relative permeability, μ_r.

3.1.8.2 *(permanent) magnetization (M)*—parameter that specifies a magnetic state of material bodies such as weights, in the absense of an external magnetic field (most generally, magnetization is a vecotr whose magnitude and direction are not necessarily constant within the material). The magnetization of a body generates an inhomogeneous magnetic field in space and thus may produce magnetic forces on other materials.

3.1.9 *mass*—physical quantity, which can be ascribed to any material object and which gives a measure of its quantity of matter. The unit of mass is the kilogram.

3.1.10 *maximum permissible errors*—the maximum amount by which the sum of the conventional mass of the weight, its deviation from nominal value and its associated uncertainty is allowed to deviate from the assigned nominal value.

3.1.11 *metrological traceability*—property of a measurement result whereby the result can be related to a reference through a documented unbroken chain of calibrations, each contributing to the measurement uncertainty. Metrological traceability requires an established calibration hierarchy. Elements for confirming metrological traceability to be an unbroken chain to an international measurement standard or a national measurement standard (IPK or NPS), shall include a documented measurement uncertainty, a documented measurement procedure, accredited technical competence, metrological traceability to the SI, and established calibration intervals (see current VIM: JCGM 200).

3.1.12 *reference standard*—a standard, generally of the highest metrological quality available at a given location, from which measurements made at that location are derived.

3.1.13 *roughness parameter or R-parameter (R_a or R_z)*—parameter that describes the assessed roughness profile of a sample. The letter R is indicative of the type of assessed profile, in this case R for roughness profile. The assessed profile of a sample can be in terms of different profile types: a roughness profile or R-parameter, primary profile or P-parameter, a waviness profile or W-parameter.

3.1.14 *set of weights*—a series of weights, usually presented in a case so arranged to make possible any weighing of all loads between the mass of the weight with the smallest nominal value and the sum of the masses of all weights of the series with a progression in which the mass of the smallest nominal value weight constitutes the smallest step of the series.

3.1.15 *temperature (t)*—in degrees Celsius, is related to the absolute thermodynamic temperature scale, called the Kelvin scale, by $t = T - 273.15$ K.

3.1.16 *test weight (m_t)*—weight that is to be tested according to this standard.

3.1.17 *tolerance test*—verification that the conventional mass of the weights and their corresponding uncertainties as tested are correct within the maximum permissible errors of the respective weight class.

3.1.18 *uncertainty*—non-negative parameter characterizing the dispersion of the quantity values being attributed to a measurand, based on the information used.

3.1.19 *units*—the units used are: *(1)* for mass, the milligram (mg), the gram (g) and the kilogram (kg); *(2)* for density, the kilogram per cubic meter (kg m^{-3}).

3.1.20 *U.S. National prototype standard*—platinum-iridium kilogram identified as K20, maintained at the National Institute of Standards and Technology, with value assigned relative to the International Prototype Kilogram provides the United States access to the mass unit.

3.1.21 *weight*—material measure of mass, regulated in regard to its physical and metrological characteristics: shape, dimensions, material, surface quality, nominal value, density, magnetic properties and maximum permissible error.

NOTE 1—The term "weight" is also used as the physical quantity of the gravitational force of a body. From the context it is usually clear in which sense the term is used. If the sense is not clear, one may use the words "weight force" or "weight piece," depending on its meaning.

3.2 *Symbols:*

Symbol	Unit	Definition
A	–	represents weighing the reference weight in a weighing cycle
B	–	represents weighing the test weight in a weighing cycle
C	–	correction factor for air buoyancy
D	kg	difference of balance readings between minimum and maximum values from eccentricity test
d	kg	scale interval
d_1	m	estimated distance between centers of weights during loading
d_2	m	estimated distance from the center of the load receptor to one of the corners
F_b	N	air buoyancy equal to the weight of the displaced air
F_g	N	gravitational force
F_z	N	magnetic force between a mass comparator and a weight in the vertical or z-direction
g	m s^{-2}	gravitational acceleration
H	A m^{-1}	magnetizing field strength
hr	%	relative humidity
I	kg	indication of the weighing instruments (scale division)
ΔI	kg	indication difference of the balance, where $\Delta I = I_t - I_r$
ΔI_1	kg	indication difference using an automatic exchange mechanism with weights in first position
ΔI_2	kg	indication difference using an automatic exchange mechanism with weights in reversed position
ΔI_s	kg	change in indication of balance due to sensitivity weight
i	–	subscript used as an index in summations
j	–	subscript for number of test weights or number of series of measurements
k	–	coverage factor, typically 2 or 3
M	A m^{-1}	permanent magnetization (see also $\mu_0 M$)
m	kg	mass of a rigid body (weight)
Δm	kg	mass difference, usually between test and reference weight
δm	kg	maximum permissible error on the weights
m_0	kg	mass, nominal value of the weight (e.g. 1 kg)
m_c	kg	conventional mass of the weight
Δm_c	kg	conventional mass difference between test weight and reference weight
$\overline{\Delta m_c}$	kg	average conventional mass difference between test weight and reference weight
m_{cr}	kg	conventional mass of the reference weight
m_{ct}	kg	conventional mass of the test weight
m_s	kg	mass of the sensitivity weight
m_t	kg	mass of the test weight
n	–	subscript for number of measurement sequences
p	Pa	barometric pressure
R_a	µm	mean height of roughness profile (R-parameter)
R_z	µm	maximum height of roughness profile (R-parameter)
r	–	subscript for reference weight
s	–	subscript for sensitivity weight
s	kg	standard deviation
s^2	kg^2	variance
T	K	thermodynamic temperature using the International Temperature Scale of 1990 (ITS-90)
ΔT^*	°C	initial difference between weight temperature and laboratory temperature
t	–	subscript for test weight
t	°C	temperature in degrees Celsius, where $t = T - 273.15$ K
U	kg	uncertainty, expanded uncertainty
u	kg	uncertainty, standard uncertainty
u_b	kg	uncertainty of air buoyancy correction
u_{ba}	kg	uncertainty of the balance
u_c	kg	combined standard uncertainty
u_d	kg	uncertainty due to the display resolution of a digital balance
u_E	kg	uncertainty due to eccentricity
u_F	kg m^{-3}	uncertainty of the formula used to calculate air density
u_{hr}	%	uncertainty in relative humidity
u_{inst}	kg	uncertainty due to instability of the reference weight
u_{ma}	kg	uncertainty due to magnetism
u_p	Pa	uncertainty in barometric pressure
u_s	kg	uncertainty due to the sensitivity of the balance
u_t	°C	uncertainty in temperature
u_w	kg	uncertainty due to the weighing process
V	m^3	volume of a solid body (weight)
z	m	vertical cartesian coordinate
µ	N A^{-2}	magnetic permeability
μ_0	N A^{-2}	magnetic constant (magnetic permeability of vacuum), $\mu_0 = 4\pi \times 10^{-7}$ N A^{-2}
$\mu_0 M$	T	magnetic polarization
μ_r	–	relative magnetic permeability (μ/μ_0)
v_{eff}	–	effective degrees of freedom
ρ	kg m^{-3}	mass of a rigid body (weight)
ρ_0	kg m^{-3}	density of air as a reference value equal to 1.2 kg m^{-3}
ρ_a	kg m^{-3}	density of moist air
ρ_{al}	kg m^{-3}	density of moist air during the last (previous) calibration of the reference weight
ρ_r	kg m^{-3}	density of a reference weight with mass m_r
ρ_t	kg m^{-3}	density of the weight being tested
χ	–	magnetic susceptibility

4. Maximum Permissible Errors

4.1 For each weight, the expanded uncertainty U at approximately 95 % confidence (See Section 9) of the conventional mass shall be less than or equal to one-third of the maximum permissible error given in Table 1 as defined in Section 9.

TABLE 1 Maximum Permissible Errors

NOTE 1—Maximum Permissible Errors are reported in SI units, typically milligrams.

NOTE 2—The "grain" is the same in avoirdupois, troy and apothecaries units of mass.

NOTE 3—See NIST SP 811 and NIST SP 1038 for conversion and units of measure.
