This document is not an ASTM standard and is intended only to provide the user of an ASTM standard an indication of what changes have been made to the previous version. Because it may not be technically possible to adequately depict all changes accurately, ASTM recommends that users consult prior editions as appropriate. In all cases only the current version of the standard as published by ASTM is to be considered the official document.

Designation: B928/B928M - 09 B928/B928M - 13

### Standard Specification for High Magnesium Aluminum-Alloy Sheet and Plate for Marine Service and Similar Environments<sup>1</sup>

This standard is issued under the fixed designation B928/B928M; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\varepsilon$ ) indicates an editorial change since the last revision or reapproval.

#### 1. Scope\*

1.1 This specification covers high magnesium (Note 1) marine application aluminum-alloy (Note 21), in those alloy-tempers shown in Table 2 [Table 2] Table 3] and Table 4 [Table 4 [Table 5], [Table 5], for flat sheet, coiled sheet, and plate, in the mill finish condition that are intended for marine and similar environments: hull construction and other marine applications where frequent or constant direct contact with seawater is expected and for similar environments (Note 2).

Note 1-The term high magnesium in the general sense includes those alloys containing 3 % or more nominal magnesium.

NOTE 1-Throughout this specification use of the term alloy in the general sense includes aluminum as well as aluminum alloy.

NOTE 2—There are other aluminum alloy-temper products that may be suitable for use in marine and similar environments, but which may not require the corrosion resistance testing specified by B928/B928M. See Specification B209 or B209M for other aluminum sheet and plate alloy-temper products.

1.2 Alloy and temper designations are in accordance with ANSI H35.1/H35.1(M). The equivalent Unified Numbering System alloy designations are those of Table 1 preceded by A9, for example, A95083 for 5083 in accordance with Practice E527.

1.3 The values stated in either SI units (<u>(Table Table 3 3 and Table 5)</u> or inch-pound units (<u>(Table Table 2 2 and Table 4)</u> Table 4) are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of each other. Combining values from the two systems may result in non-conformance with the standard.

1.4 For acceptance criteria for inclusion of new aluminum and aluminum alloys in this specification, see Annex A2.

1.5 This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

TABLE 1 Chemical Composition Limits<sup>A,B,C,H</sup>

				TABLE I C	nemical Co	pmposition L							
Alloy	Silicon	Iron	Copper	Manganese	Magnesium	Chromium	Zinc	Titanium	Each	Total <sup>E</sup>			
<del>5059</del>		0.45		0.50		0.25		0.6 to 1.2		5.0 to 6.0	_	<del>0.25</del>	-0.
5059		0.45		0.50		0.25		0.6 to 1.2		5.0 to 6.0		0.25	0.
5083	0.40	0.40	0.10	0.40 to 1.0	4.0 to 4.9	0.05 to 0.25	0.25	0.15	0.05	0.15	remainder		
5086		0.40		0.50		0.10		0.20 to 0.7		3.5 to 4.5		0.05 to 0.	.25 0
<del>5383</del>		0.25		<del>0.25</del>		0.20		0.7 to 1.0		4.0 to 5.2		<del>0.25</del>	-0
5383		0.25		0.25		0.20		0.7 to 1.0		4.0 to 5.2		0.25	0
5456	0.25	0.40	0.10	0.50 to 1.0	4.7 to 5.5	0.05 to 0.20	0.25	0.20	0.05	0.15	remainder		

<sup>A</sup> Limits are in weight percent maximum unless shown as a range or stated otherwise.

<sup>B</sup> Analysis shall be made for the elements for which limits are shown in this table.

<sup>C</sup> For purposes of determining conformance to these limits, an observed value or a calculated value attained from analysis shall be rounded to the nearest unit in the last right-hand place of figures used in expressing the specified limit, in accordance with the rounding-off method of Practice E29. <sup>D</sup> Others include listed elements for which no specific limit is shown, as well as unlisted metallic elements, but doesn't include elements shown with composition limits in

the footnotes. The producer may analyze samples for trace elements not specified in the specification. However, such analysis is not required and may not cover all metallic Others elements. Should any analysis by the producer or the purchaser establish that an Others element exceeds the limit of Each or that the aggregate of several Others elements exceeds the limit of Total, the material shall be considered nonconforming.

<sup>E</sup> Other Elements—Total shall be the sum of unspecified metallic elements 0.010 % or more, rounded to the second decimal before determining the sum. <sup>F</sup> 0.05 to 0.25 Zr.

<sup>G</sup> 0.20 Zr max.

<sup>H</sup>In case of a discrepancy in the values listed in Table 1 with those listed in the International Alloy Designations and Chemical Composition Limits for Wrought Aluminum and Wrought Aluminum Alloys (known as the "Teal Sheets"), the composition limits registered with the Aluminum Association and published in the "Teal Sheets" shall be considered the controlling composition. The "Teal Sheets" are available at http://www.aluminum.org/tealsheets.

#### 3. Terminology

3.1 Definitions—Refer to Terminology B881 for definitions of product terms used in this specification.

3.2 Definitions of Terms Specific to This Standard:

3.2.1 exfoliation—corrosion that proceeds laterally from the sites of initiation along planes parallel to the original rolling surface, generally at grain boundaries, forming corrosion products that force metal away from the body of the material, giving rise to a layered appearance.

3.2.2 high magnesium aluminum alloys-in the general sense, includes those 5xxx alloys containing 3% or more nominal magnesium.

3.2.3 intergranular corrosion—corrosion that preferentially occurs at, or adjacent to, the grain boundaries of a metal or alloy. 3.2.4 lot—an inspection lot shall consist of an identifiable quantity of material of the same mill form, alloy, temper, cast or melt lot, and thickness, subjected to inspection at one time.

3.2.5 sensitization—the development of a continuous or nearly continuous grain boundary precipitate in 5xxx alloy-temper material, that causes the material to be susceptible to intergranular forms of corrosion.

<sup>&</sup>lt;sup>3</sup> The last approved version of this historical standard is referenced on www.astm.org.

<sup>&</sup>lt;sup>4</sup> Available from Aluminum Association, Inc., 1525 Wilson Blvd., Suite 600, Arlington, VA 22209, http://www.aluminum.org.

## ∰ B928/B928M – 13

3.2.6 *stress-corrosion cracking*—a cracking process that requires the simultaneous action of a corrodent, and sustained tensile stress. (This excludes corrosion-reduced sections, which fail by fast fracture. It also excludes intercrystalline or transcrystalline corrosion which can disintegrate an alloy without either applied or residual stress.)

#### 4. Ordering Information

4.1 Orders for material to this specification shall include the following information:

- 4.1.1 This specification designation (which includes the number, the year, and the revision letter, if applicable),
- 4.1.2 Quantity in pieces or pounds [kilograms],
- 4.1.3 Alloy (see 7.1 and Table 1),

4.1.4 Temper (see 8.1 and Table 2 and Table 4 [Table 3 and Table 5]),

4.1.5 For sheet, whether flat or coiled, and

4.1.6 Dimensions (thickness, width, and length or coil size).

4.2 Additionally, orders for material to this specification shall include the following information when required by the purchaser:

4.2.1 Whether inspection or witness of inspection and tests by the purchaser's representative is required prior to material shipment (see  $\frac{11.12.1}{1.12.1}$ ),

4.2.2 Whether Practices B660 applies and, if so, the levels of preservation, packaging, and packing required (see  $\frac{15.316.3}{1.31}$ ), 4.2.3 Whether certification is required (see Section  $\frac{1314}{1.31}$ ), and.

4.2.4 Whether G66 and G67 testing is the required lot release method for the H116 and H321 tempers (see 9.5),

4.2.5 Whether the G66 and G67 test results are to be included in the certification (see Section 14), and

4.2.6 Whether tensile testing should be in the longitudinal or long transverse direction (see 8.5).

#### 5. Responsibility for Quality Assurance

5.1 *Responsibility for Inspection and Tests*—Unless otherwise specified in the contract or purchase order, the producer is responsible for the performance of all inspection and test requirements specified herein. The producer Producers may use histheir own or any other suitable facilities for the performance of the inspection and test requirements specified herein, unless disapproved by the purchaser in the order or at the time of contract signing. The purchaser shall have the right to perform any of the inspections and tests set forth in this specification where such inspections are deemed necessary to ensure that material conforms to prescribed requirements.

5.2 Lot Definition—An inspection lot shall consist of an identifiable quantity of material of the same mill form, alloy, temper, east or melt lot, and thickness, subjected to inspection at one time.

#### 6. General Quality

### ASTM B928/B928M-13

6.1 Unless otherwise specified, the material shall be supplied in the mill finish, shall be uniform as defined by the requirements of this specification and shall be commercially sound. Any requirement not so covered is subject to negotiation between producer and purchaser.

6.2 Each coil, sheet and plate shall be examined to determine conformance to this specification with respect to general quality and identification marking. On approval of the purchaser, however, the producer may use a system of statistical quality control for such examinations.

#### 7. Chemical Composition

7.1 *Limits*—The sheet and plate shall conform to the chemical composition limits specified in Table 1. Conformance shall be determined by the producer, by taking samples in accordance with E716 when the ingots are poured and analyzing those samples in accordance with E607, E1251, E34 or EN 14242. At least one sample shall be taken for each group of ingots poured simultaneously from the same source of molten metal. If the producer has determined the chemical composition during pouring of the ingots, they shall not be required to sample and analyze the finished product.

7.2 If it becomes necessary to analyze the finished or semifinished product for conformance to chemical composition limits, the method used to sample the finished or semifinished product for the determination of chemical composition shall be by agreement between the producer and the purchaser. Analysis shall be performed in accordance with methods of sampling and methods E716, E607, E1251, E34 or EN 14242 (ICP method). The number of samples taken for determination of chemical composition of analysis shall be as follows:provided in the following:

7.2.1 <u>Methods of Sampling</u>—When samples are taken from the finished or semifinished product, a sample Samples for chemical analysis shall be taken to represent each 4000 lb [2000 kg] or fraction thereof, of material in the lot, exceptin accordance with Practice B985 that not more than one sample shall be required per piece.

7.2.2 *Methods of Analysis*—Analysis shall be performed in accordance with Test Method E607, Test Method E1251, Test Methods E34, or CEN EN 14242 (ICP method).

## B928/B928M - 13

		Specified Thickness, mm					Tensile Strength, MPa		
Temper	over	through	min	max	min	max	in 50 mm	in 5× Diamete $\frac{(5.65\sqrt{A})}{\sqrt{A}}$	r
	<u>12.50</u> <u>40.00</u> <u>40.00</u>	40.00 80.00 80.00	305 285 285	385 370 370	215 200 200		<u></u> 	<u>10</u> <del>10</del> <u>10</u>	_

<sup>A</sup> To determine conformance to this specification, each value for tensile strength and for yield strength shall be rounded to the nearest 1 MPa and each value for elongation to the nearest 0.5 %, both in accordance with the rounding method of Practice E29.

<sup>B</sup> The basis for establishment of mechanical property limits is shown in Annex A1.

<sup>c</sup> Elongations in 50 mm apply for thicknesses up through 12.50 mm and in 5× diameter (5.65  $\sqrt{A}$ ) for thicknesses over 12.50 mm where mm. A is the cross sectional area of the specimen.

<sup>D</sup> Tentative — properties subject to revision.

#### TABLE 4 Long Transverse Mechanical Property Limits, Inch-Pound Units<sup>A,B</sup>

Temper –	Specified Thickness, in.	Tensile St	rength, ksi	Yield Strength (0	Elongation in 2 in. – or ×4 Diameter,	
Temper		min	max	min	max	min, %
		Alloy	5083

<sup>A</sup>To determine conformance to this specification, each value for tensile strength shall be rounded to the nearest 1 MPa and each value for elongation to the nearest 0.5 %, both in accordance with the rounding method of Practice E29.

<sup>B</sup>The basis for establishment of mechanical property limits is shown in Annex A1.

<sup>C</sup>Elongations in 50 mm apply for thicknesses up through 12.50 mm and in 5× diameter (5.65 /A) for thicknesses over 12.50 mm where mm A is the cross sectional area of the specimen. <sup>D</sup> Tentative — properties subject to revision.

#### 8. Tensile Properties of Material as Supplied

8.1 Limits—The sheet and plate shall conform to the requirements for tensile properties as specified in Table 2 [Table 3] or Table 4 [Table 5]. Table 2 [Table 3] includes specification limits for tensile properties in the longitudinal direction. Table 4 [Table 5] includes specification limits for tensile properties in the long transverse direction.

8.1.1 Tensile property limits for sizes not covered in Table 2 or Table 4 [Table 3 or Table 5] shall be as agreed upon between the producer and purchaser and shall be so specified in the contract or purchase order.

8.2 Number of Samples—One sample shall be taken from each end of each parent coil, or parent plate, but no more than one sample per 2000 lb [1000 kg] of sheet or 4000 lb [2000 kg] of plate, or part thereof, in a lot shall be required. Other procedures for selecting samples may be employed if agreed upon between the producer and purchaser.

8.3 Test Specimens—Geometry of test specimens and the location in the product from which they are taken shall be as specified in Test Methods B557 or B557M, with the exception that the test direction will be as specified in 8.5.

8.4 Test Methods—The tension test shall be made in accordance with Test Methods B557 or B557M.
