Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee TC 107, *Metallic and other inorganic coatings*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

Thermal power generation is the main form of power generation in the world. As an important part of the thermal power plant, the safe and stable operation of the boiler is very important for the thermal power plant. However, the four tubes of the boiler (water wall, superheater, reheater and economizer) are in contact with the flame or high-temperature flue gas for a long time, and the working environment is harsh. During operation, the tubes are affected by wear, high-temperature oxidative corrosion, high-temperature operation and other factors, which lead to leakage and directly threaten the safe operation of the thermal power plant. Thermally sprayed technology is an effective technology to improve the surface quality and prolong the service life of boiler tubes. So far, thermal spraying technology and metal and metal ceramic coatings have been widely used in the protection of various boilers (such as circulating fluidized bed boilers and biomass boilers) in the global energy industry. In the process of power plant operation, the type of coating is determined by the specific working conditions of various boiler tubes.

This document provides guidance for the application of thermal sprayed coatings on four boiler tubes and promotes technical progress in the energy industry.
