Designation: D5517 – 14

Standard Test Method for Determining Extractability of Metals from Art Materials[1]

This standard is issued under the fixed designation D5517; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This test method covers the extraction of metals from art materials using an extractant that simulates the acid potential of gastric juice. This test method is similar to the extraction method in Specification F963, except that it requires conducting extraction steps at body temperature instead of at room temperature. The extraction procedure specified in this test method is more rigorous than that noted in Specification F963 because the procedure causes the extraction of a larger quantity of metal.

1.2 This test method is adapted from the European Toy Safety Standard, EN 71-3:1994 but differs from it in that a solvent extraction step is not required for processing waxes or oil-based products and no specific acceptable metal levels are specified.

1.3 The rational for this test method is discussed in Appendix X1.

1.4 This test method should be used on the art material as a whole and not an art material ingredient. Testing the art material as whole would be expected to give a more accurate estimate of soluble metal than from an extrapolation from testing ingredients.

1.5 The values stated in SI units are to be regarded as standard. No other units of measurement are included in this standard.

1.6 *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.*

3. Terminology

3.1 *Definitions:*

3.1.1 For formal definitions of statistical terms see Terminology E456.

3.2 *Definitions of Terms Specific to This Standard:*

3.2.1 *base material, n*—material upon which coatings are deposited or formed.

3.2.2 *bioavailability, n*—the extent that a substance can be absorbed in a biologically active form.

3.2.3 *coating, n*—all layers of material covering the base material.

3.2.4 *detection limit, n*—three times the standard deviation of the blank value.

3.2.5 *scraping, v*—removal of a coating down to the base material without removing any portion of the base material; the use of solvents is not permitted.

4. Summary of Test Method

4.1 A powdered, liquid, comminuted or ground art material is mixed with a 0.07 *N* hydrochloric acid solution and, after adjusting the pH to 1.5, is shaken for 1 h and then allowed to sit for an additional hour. These extraction steps are conducted at 37 ± 2°C. Solids are separated from the extractant by centrifugation and filtration through a 0.45-µm filter. The resultant eluate is then analyzed for the metal(s) of interest.

5. Significance and Use

5.1 This acid extraction method is intended to indicate the solubility of metals from art materials in a weak acid medium. This test method may be useful as one indicator of the amount of metal that is readily available for absorption. It is not meant as a replacement for *in vivo* tests of absorption of a metal.[6] Other relevant information, when available, should be included in the overall toxicological assessment of metal-containing art materials, such as physico-chemical properties, toxicokinetics (absorption, distribution, metabolism and excretion), and mechanisms of toxicity of the metal(s) of interest.

5.2 Maximum levels of metal extraction are seen with this test method when results are 250 ppm or less. If results are greater than 250 ppm, the extractant volume should be increased to 100 mL.[7]

6. Apparatus

6.1 *Metal Sieve* of aperture 0.5 mm.

6.2 *pH meter* with an accuracy of ±0.1 pH units.

6.3 *Membrane Filter* with a pore size of 0.45 µm.

6.4 *Centrifuge* able to centrifuge at a minimum of 13 600 g.

6.5 *Precision Reciprocal Shaker* 150 oscillations/min with 1 in. stroke length or *wrist-action shaker* capable of controlling the shaking amplitude to 4 ± 2 mm and the frequency to 9 ± 2 Hz.

6.6 *Constant Temperature Water Bath* at 37 ± 2°C.

7. Reagents

7.1 *Hydrochloric Acid* (0.07 *N*)—Add 2.55 g concentrated hydrochloric acid (HCl) to water and dilute to 1 L with water.

7.2 *Hydrochloric Acid* (0.14 *N*)—Add 5.10 g concentrated hydrochloric acid (HCl) to water and dilute to 1 L with water.

7.3 *Hydrochloric Acid* (2.0 *N*)—Add 72.9 g concentrated hydrochloric acid (HCl) to water and dilute to 1 L with water.

7.4 *Hydrochloric Acid* (6.0 *N*)—Add 218.8 g concentrated hydrochloric acid (HCl) to water and dilute to 1 L with water.

7.5 *Water,* of at least Grade 3 purity in accordance with ISO 3696.
